data provided by Pascal Bonnefond (CERGA)

## The CNES CLS 2011 Global Mean Sea surface

OST-ST, San-Diego, October 2011.

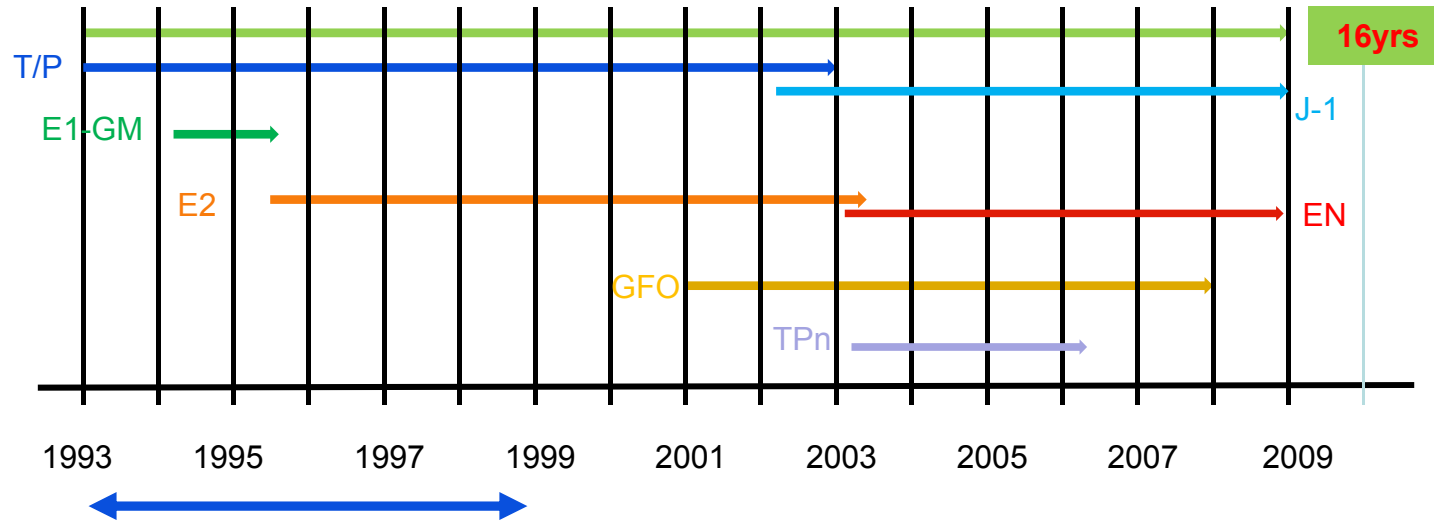

# Plan

- **Data & Processing**
- **Comparison to CLS01**
- **Comparison to DTU10**
  - ✓ **Interannual content differences**
  - ✓ **Differences at short scales**
- **Comparison to Regional GPS based MSS**

## Data & Processing

**Dataset:** using a total of 16 years of altimetric data (Mean Profiles, SLA, Geodetic Mission)

**Reference: 1993-1999 period**

• Based on GDR-C standard.

oceanic contents = 7 yrs (based on MSLA/DUACS)

• Mean Profiles & E1-GM.

	TimePeriod	Number of Years	Nb cycles	Std/ $\sqrt{2}$ (Xover)
T/P + Jason-1	1993-2008	16	11-343 + 11-250	0.8
ERS-2 + EnviSat	1995-2008	14	1-85 + 22-72	2.5
GFO	2001-2007	7	37-187	1.4
T/P interlaced	2003-2006	3	369-479	1.4
ERS-1 GM	1994-1995	2*168 days	No cycle	4.4

Unit cm

Xover are used for calibrating the error of the MSS

## Data & Processing

- **Computation of Mean Profiles & ERS-1 GM:**

- interannual & seasonal oceanic variability corrected from Optimal Analysis of SLA (Le Traon et al, 1998) >>>  $SSH_{cor}(t,\lambda,\varphi) = SSH(t,\lambda,\varphi) - OA[SLA^i_{(t,\lambda,\varphi)}]$  ;  
 $i=(1,N)$  defines a set of SLA surrounding the SSH in a space-time bubble.

- **Computation of the MSS:** Optimal Interpolation (Bretherton et al, 1976)

- Anisotropic covariance model.
  - Noise budget (3 components: instrumental, residual effect of the seasonal variability, long wavelength bias).
  - Calibrated error (Xover).
  - Over Continents (80/100 km inland) : MSS is connected to the EIGEN\_GRACE\_5C Geoid model (*Foerste et al, 2008*).
  - Spatial coverage 80°S / 84°N.
  - Cartesian grid with a step of 2 minutes.
  
- Changes for 2011 version versus 2010 version
    - Us of new parameters for inversion
    - Refinement of priori error budgets for geodesic mission

## Comparison to CLS01

- **Improvement of the shortest wavelengths ( $\lambda < 20$  km):**

analysis based on the gradient differences between the mean profiles and MSS (RMS in mm/km)

MeanProfil: **TP/J1**

Bathy criteria	CLS01	CNES_CLS10	CNES_CLS11
<i>&gt; 0 m</i>	0.7	0.7	0.4
<i>0-100 m</i>	2.1	1.2	1.0
<i>&gt; 500 m</i>	0.6	0.6	0.4

MeanProfil: **ERS-2/EnviSat**

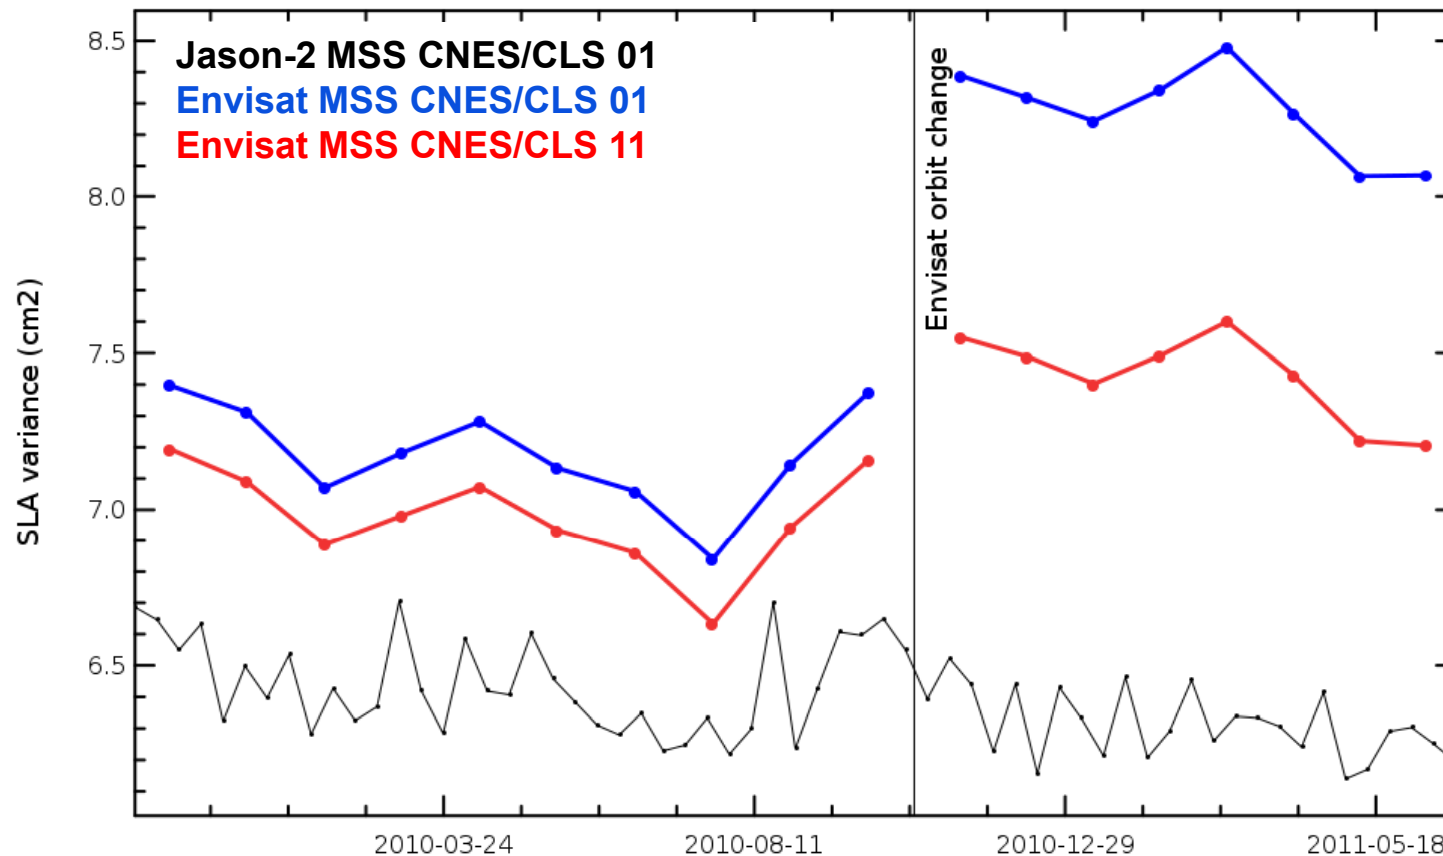

Bathy criteria	CLS01	CNES_CLS10	CNES_CLS11
<i>&gt; 0 m</i>	1.0	1.0	0.7
<i>0-100 m</i>	2.2	1.8	1.6
<i>&gt; 500 m</i>	0.9	0.9	0.6

- Concerning global ocean ( $B > 0$  m) and open ocean ( $B > 500$  m) : these statistics shows an improvement of about 50%.

- Concerning areas near the coast ( $B < 100$  m): improvement of 30 % for E2/En and 50% for TP/J1.

## Comparison to CLS01

- Computation of SLA variance on Envisat data.
- New ground track from October 2012 => independent dataset for MSS performance assessment.
- Variance of SLA filtered: wavelength <50km and >500km are removed

- Degradation on the new ground track strongly reduced when using CNES/CLS11

# Comparison to DTU10

DTU10 – CNES\_CLS11

Map of SLA  
17 yrs (DTU) vs. 7 yrs (CLS/CNES)

MSLA (cm) [1993 – Mi-2009]

DTU10\_MSLA – CNES\_CLS11

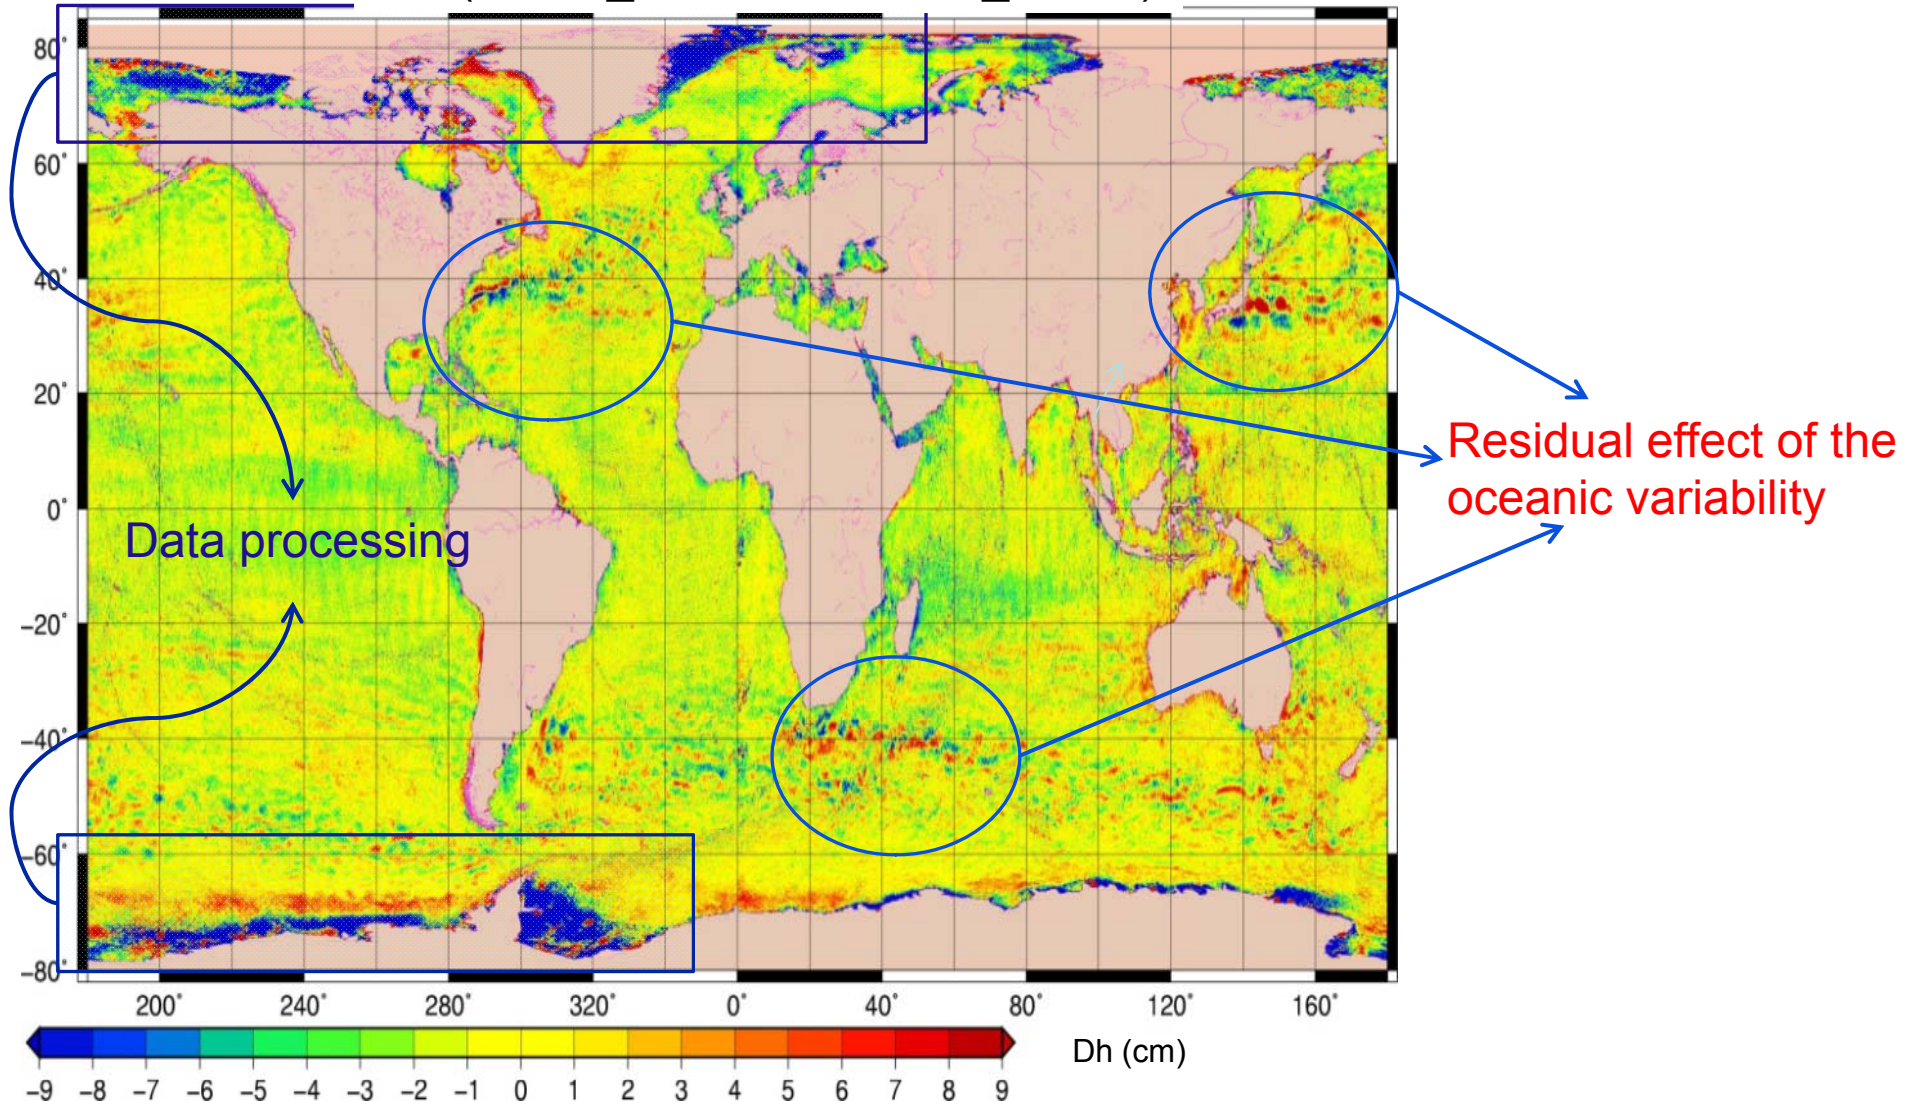

Difference between MSS  
(i.e. DTU10 & CNES\_CLS11) is  
dominated by interannual  
variability.

## Comparison to DTU10

Diff (CNES\_CLS11 – DTU10\_MSLA)

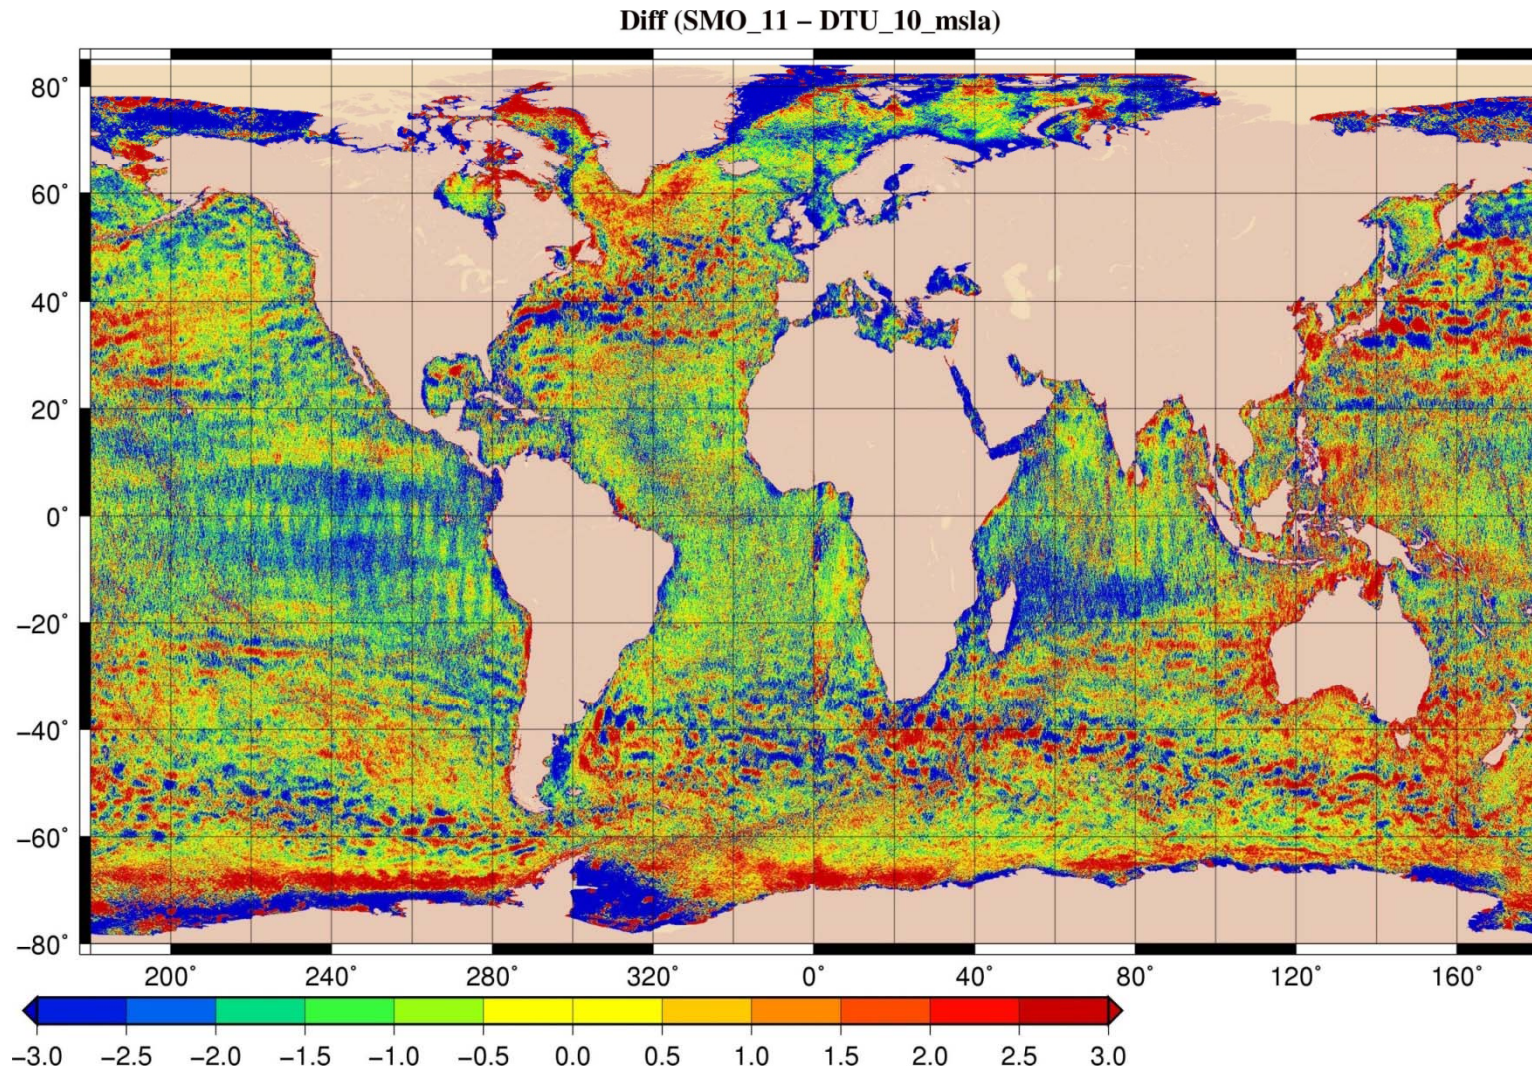

The difference between the two MSS contains residue of ocean variability and also shows differences concerning the data processing at high latitude.

## Comparison to DTU10

Changing the color scale between +/- 3 cm

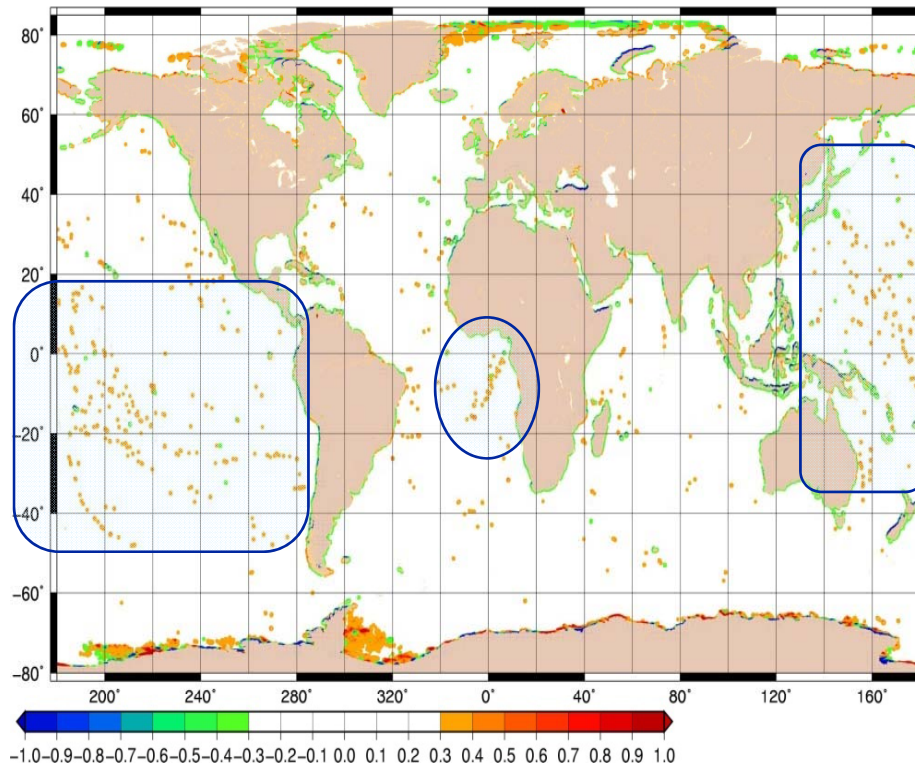

We see the differences in geophysical contents that must be further understand

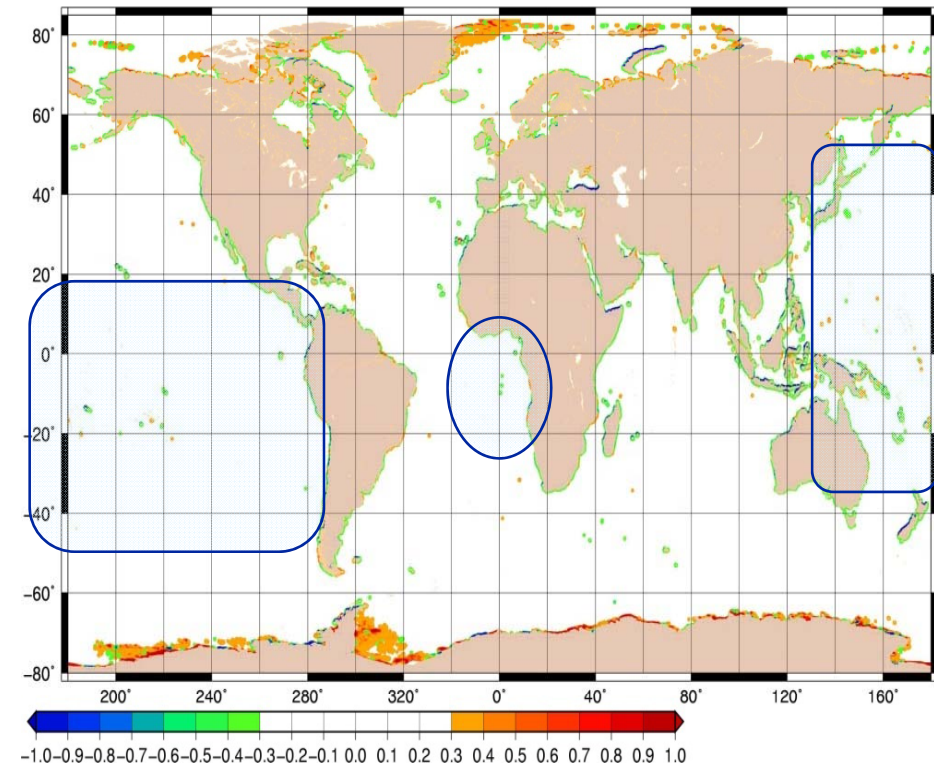

## Comparison to DTU10

- Focusing on specific differences greater than 30 cm: some seamounts (200-300) were smoothed in the CNES\_CLS10 MSS.

MSS CNES\_CLS\_10 – DTU\_10

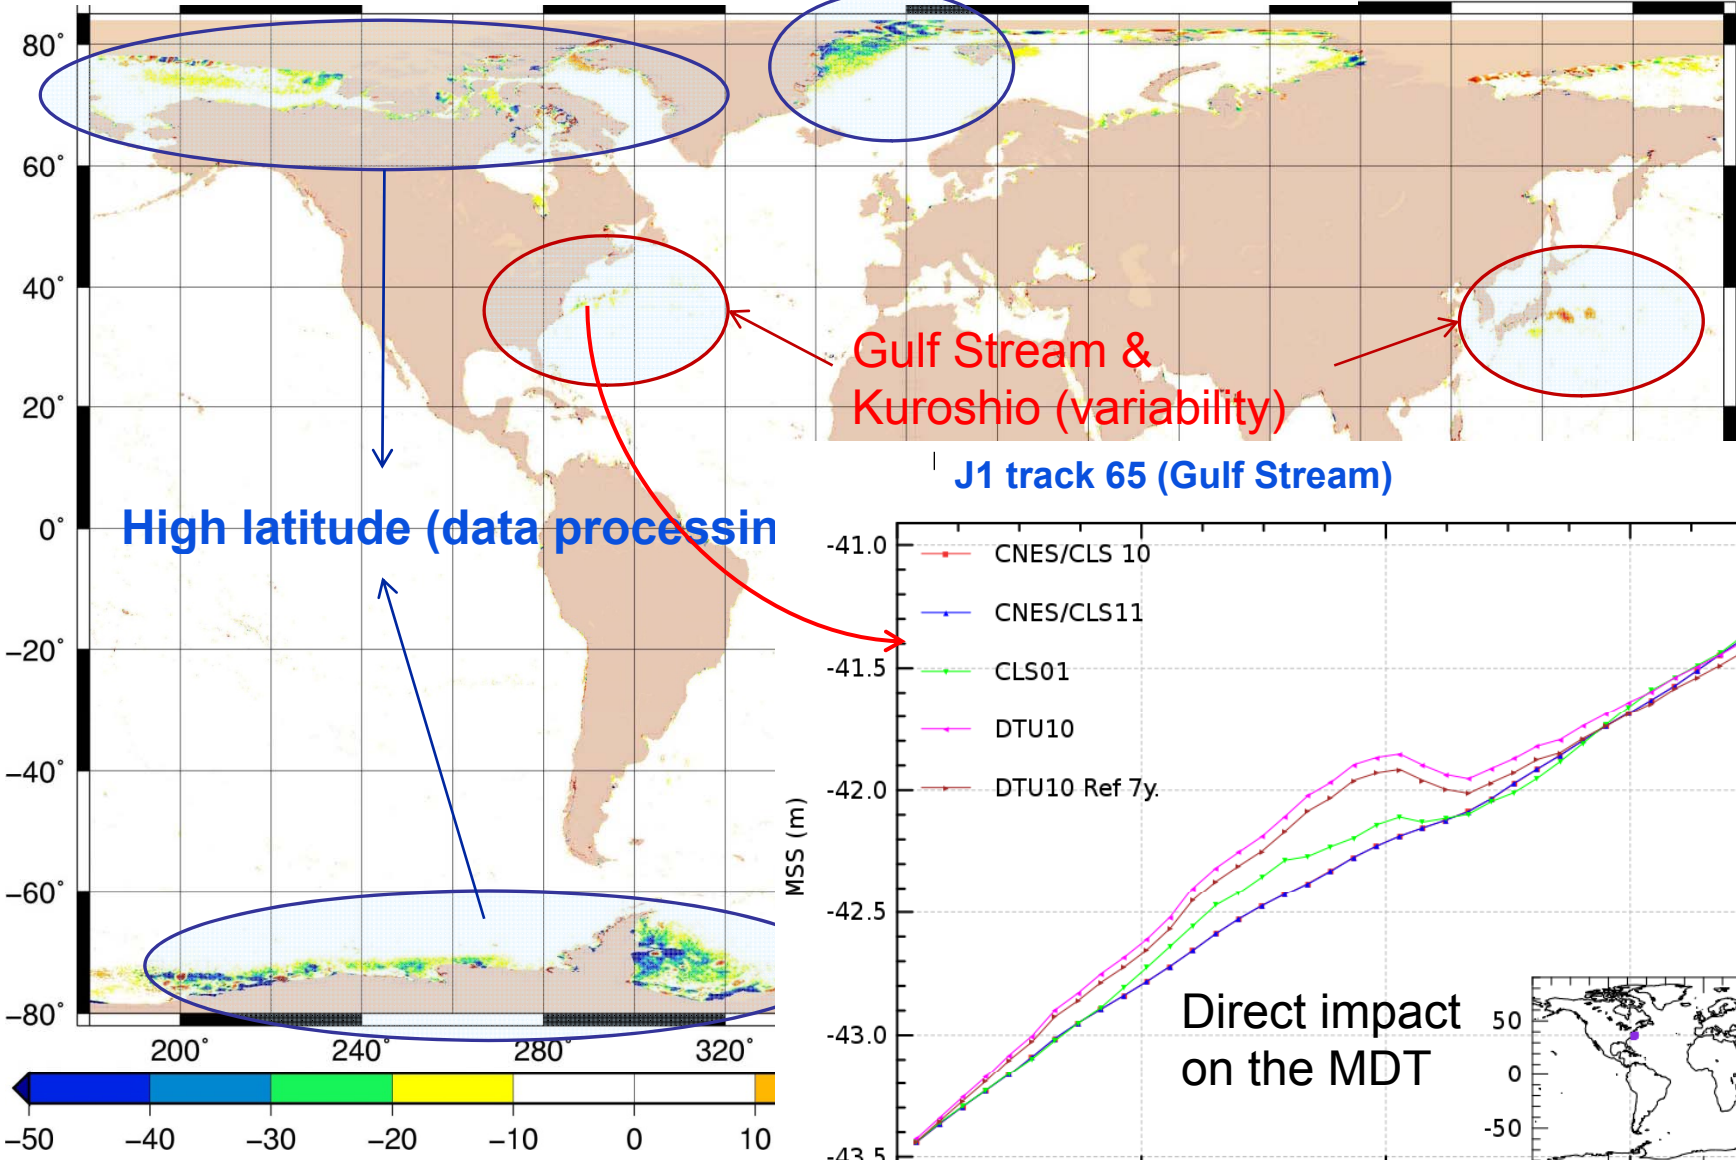

MSS CNES\_CLS\_11 – DTU\_10

- This issue is corrected in CNES\_CLS11.
- remaining differences ( $D_h > 30$  cm) are located on the coast (islands and continents). This is due to the difference in the OI (extrapolation of altimetric slope in coastal area, geoids connection, ...).

# Comparison to DTU10C

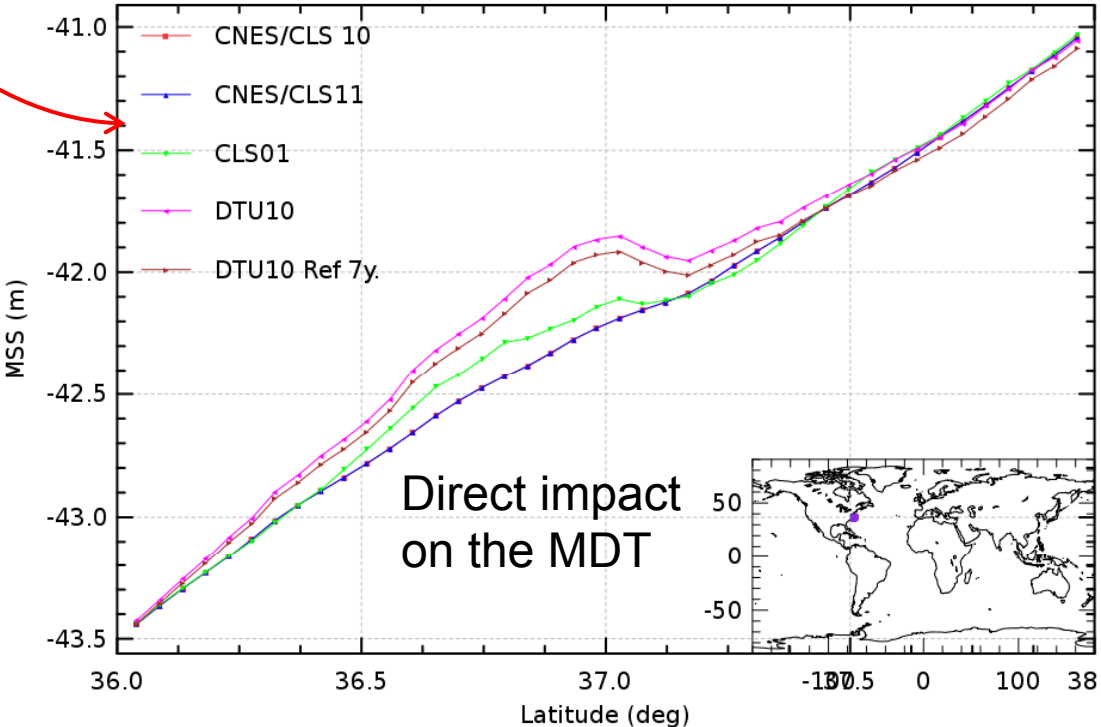

Dif (MSS CNES\_CLS11 – DTU10[MSLA]) > 10 cm

Gulf Stream & Kuroshio (variability)

J1 track 65 (Gulf Stream)

High latitude (data processing)

Direct impact on the MDT

## Impact on Sea Level Anomalies

We compute SLA statistics over **1 cycle** of Jason-1 data (cy 286) and 1 cycle of Envisat data (cy 96), over its new drifting orbit

Jason-1 SLA statistics, <b>cycle 286</b> (without Caspian sea)			
MSS	Selection	Standard deviation	Rms difference with DTU10
CNES/CLS 11 (Ref DTU10)	No selection	10.85	-2.04
DTU10		11.04	
CNES/CLS 11 (Ref DTU10)	Bathymetry < -1000m & -50° < Latitude < 50° & Ocean variability < 20cm	10.27	-1.51
DTU10		10.38	
CNES/CLS 11 (Ref DTU10)	-100 m< bathymetry < 0m	18.47	-5.84
DTU10		19.37	
CNES/CLS 11 (Ref DTU10)	Latitude < -50° & Latitude > 50°	11.89	0.84
DTU10		11.86	

Envisat SLA statistics, drifting <b>cycle 96</b> (without Caspian sea)			
Difference	Selection	Standard deviation	Rms difference with DTU10
CNES/CLS 11 (Ref DTU10)	No selection	10.56	-2.26
DTU10		10.80	
CNES/CLS 11 (Ref DTU10)	Bathymetry < -1000m & -50° < Latitude < 50° & Ocean variability < 20cm	9.37	-1.79
DTU10		9.54	
CNES/CLS 11 (Ref DTU10)	Lat < -50 or Lat > +50	10.21	-1.20
DTU10		10.28	

\* The **global difference** between SLA computed with CNES/CLS11 referenced to the content of DTU10 and DTU10 is **of -2 cm rms** (in favor of CNES/CLS11).

\* It is reduced **to -1.5 cm rms** in regions of low latitudes, deep waters and low ocean variability.

\* This difference is increased to **-5.8 cm rms** in shallow waters.

\* It is degraded to **+0.8 cm rms** when limited to high latitudes.

\* The **global difference** between SLA computed with CNES/CLS11 referenced to the content of DTU10 and DTU10 is **of -2.3 cm rms**

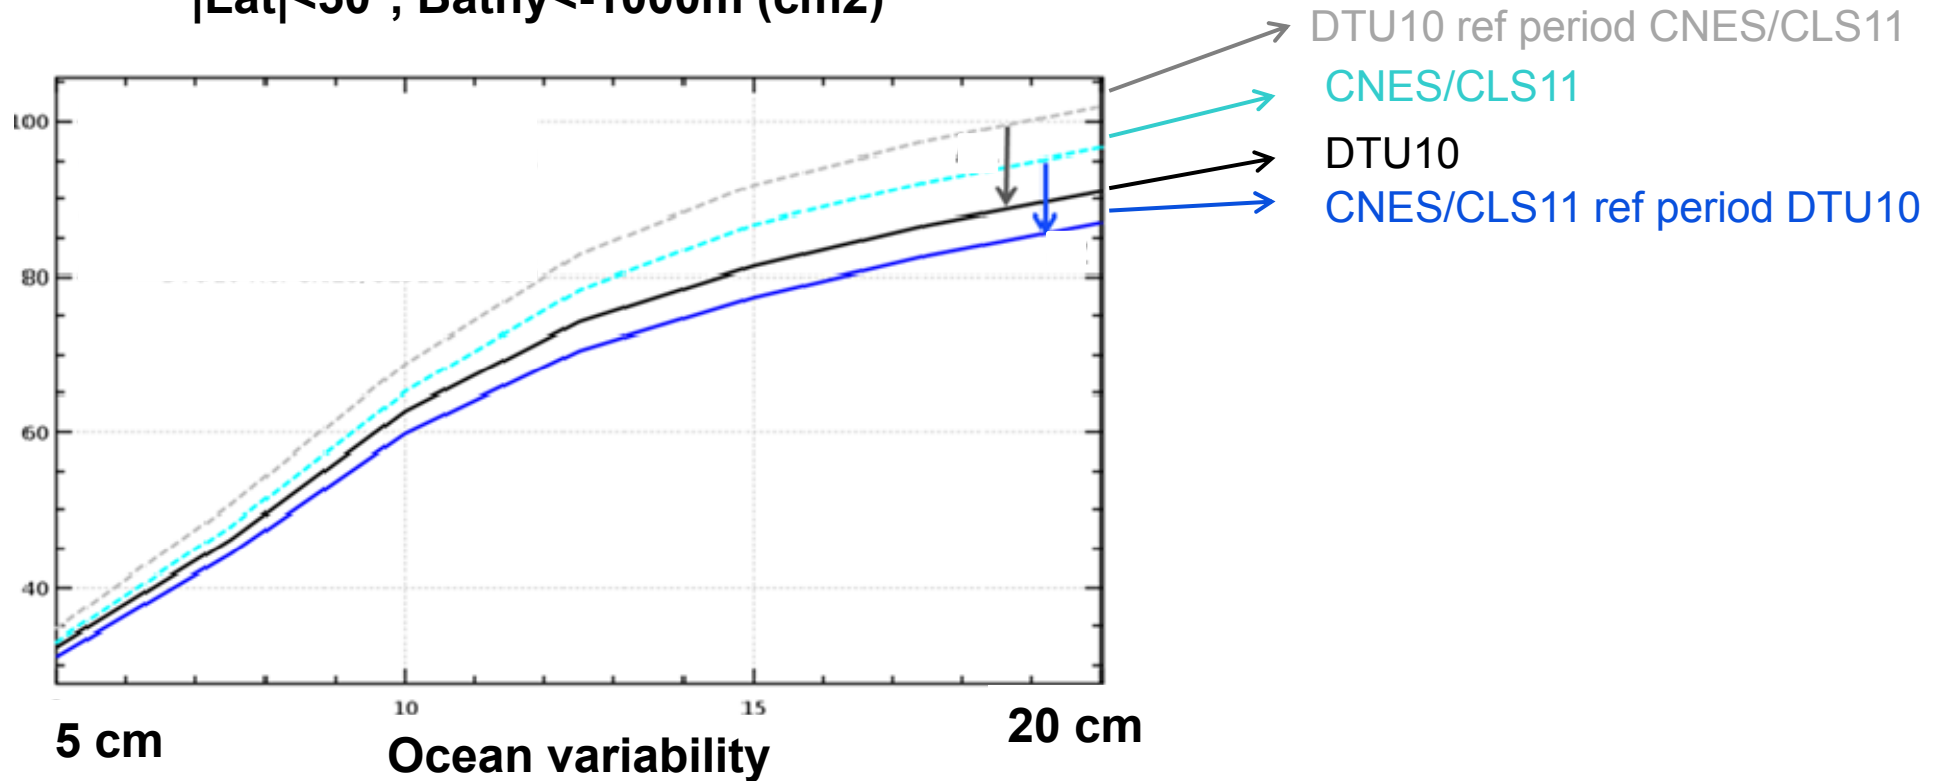

\* It is reduced to **-1.8 cm rms** in regions of low latitudes, deep waters and low ocean variability.

The **processing of inter annual ocean variability** in MSS computation is at the origin of major differences between surfaces and has to be **handled with care!**

## Comparison to DTU10C

**Impact on Sea Level Anomalies Statistics:** SLA statistics are computed over 1 cycle of Envisat data on its new orbit

**SLA variance on Envisat Cycle 96**  
 **$|\text{Lat}| < 50^\circ$ , Bathy  $< -1000\text{m}$  ( $\text{cm}^2$ )**

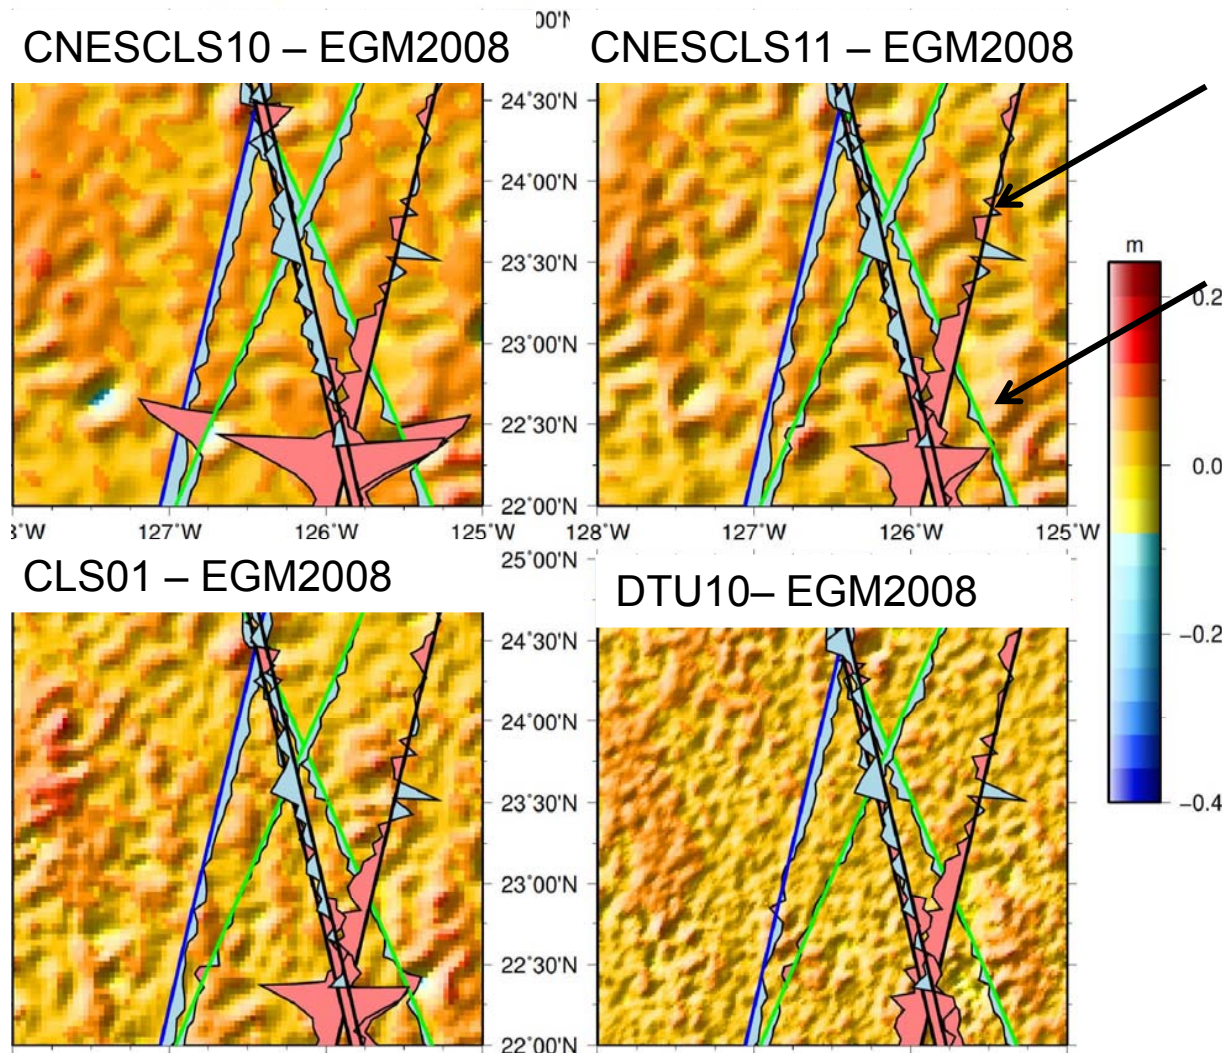

- It is crucial to compare MSS performances on the same reference period
- CNES/CLS11/DTU10 variance difference is quite consistent whatever the reference period chosen

# Comparison to DTU10

## Comparison between MSS & ERS-1 GM profiles

- courtesy Remko Scharroo

- Comparison between MSS & EGM2008 over 1 ERS-1 during geodetic phase

- 1 example of high differences between the two MSS

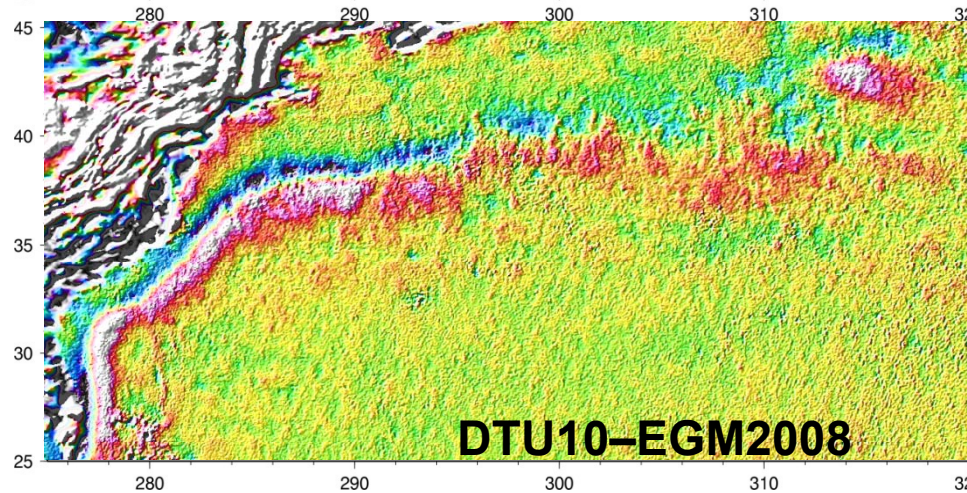

- A sea mount is probably underestimated in CNES-CLS11.

## Comparison to DTU10

### Comparison between MSS & EGM2008 - *courtesy Remko Scharroo*

- More small scales in DTU10, which may not constitute true features

- Differences are largely correlated with variations in the location of the Gulf Stream and may indicate differences in data coverage or analysis period.

# Comparisons with Local GPS MSS

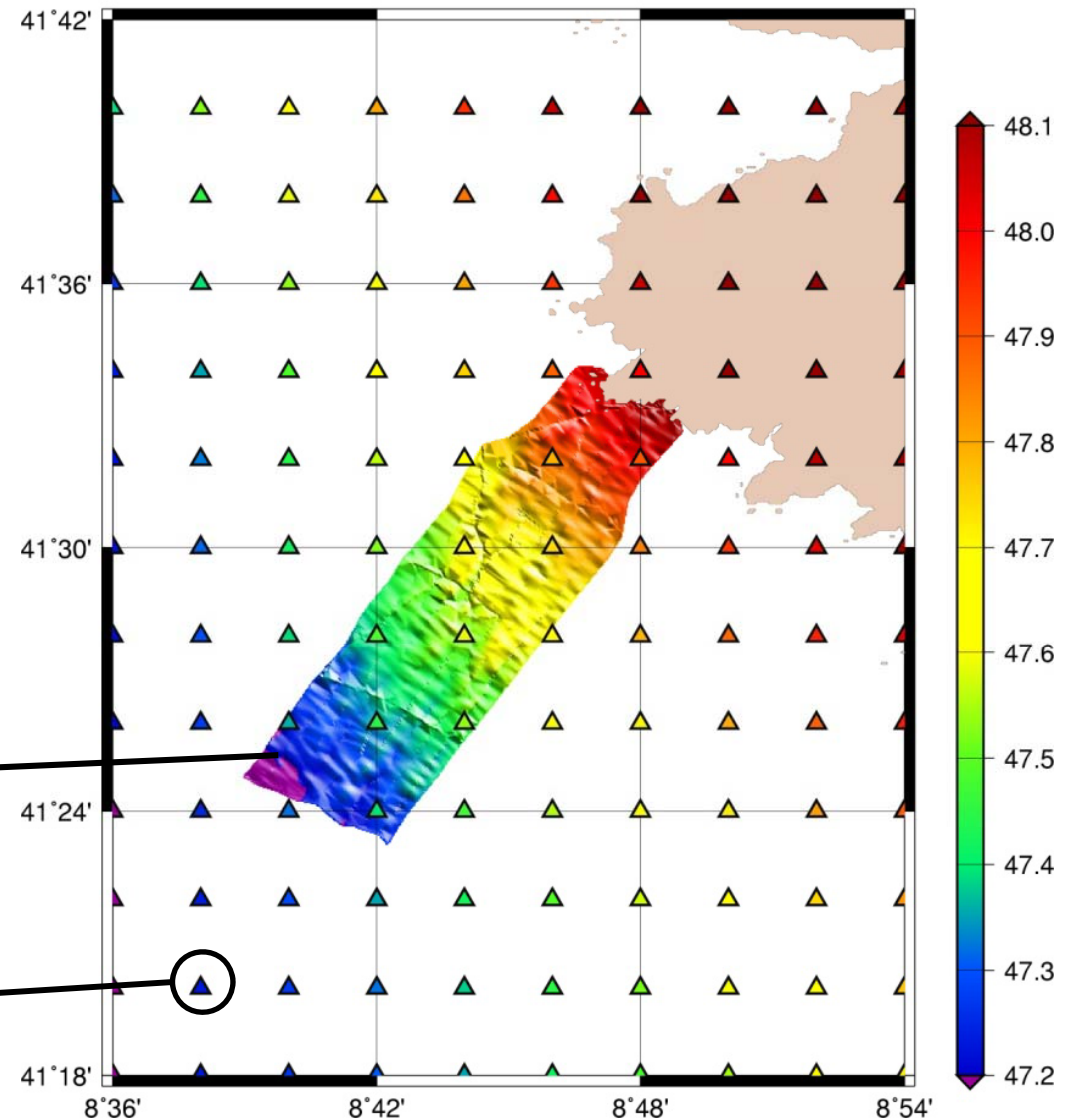

## Senetosa T/P & Janson-1/2 CalVal area

### Comparison between altimetry MSS & CERGA GPD based MSS

- Methodology described in P. Bonnefond et al., "Leveling the sea surface using a GPS catamaran,"
- Several comparison performed:
  - Corsica (2 sites)
  - Ibiza

**CERGA MSS**  
(resolution <100m)

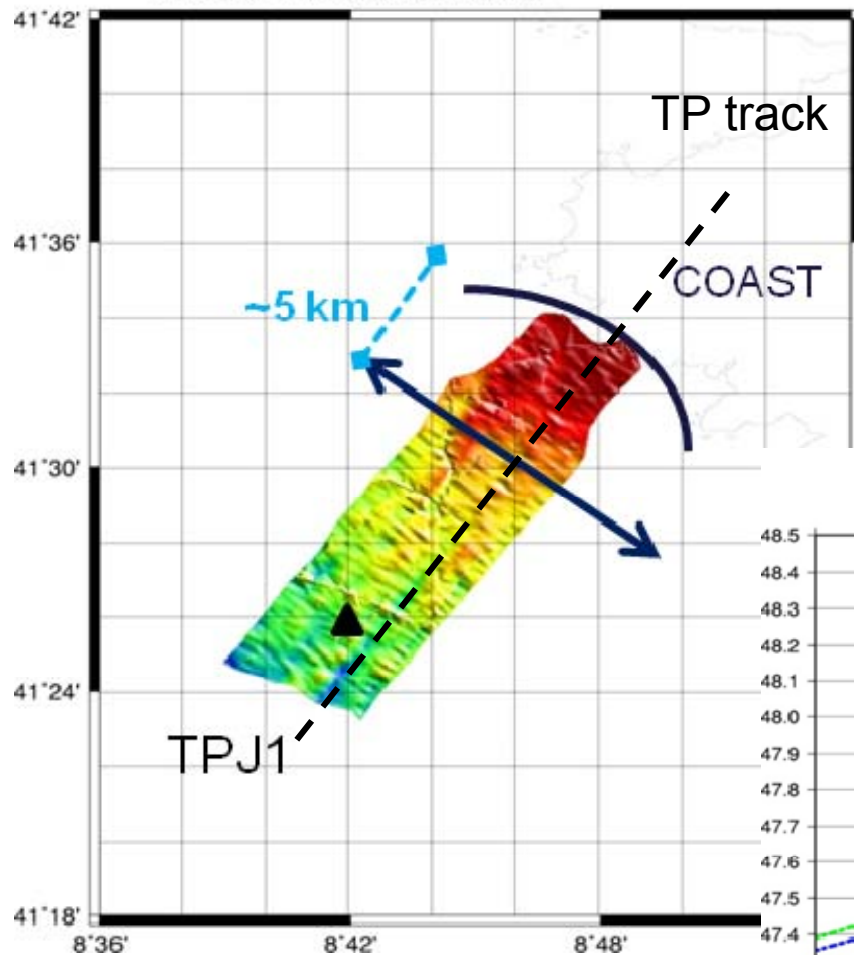

**CNES/CLS 11 MSS**  
(resolution 3 km)

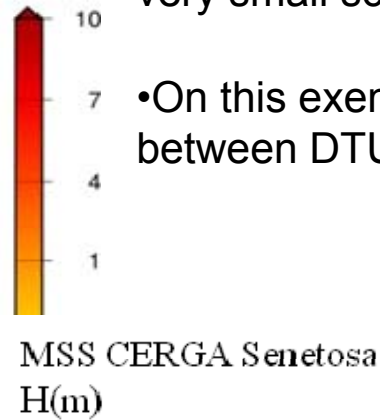

# Comparisons with Local GPS MSS

MSS CERGA - CNES\_CLS11 (cm)

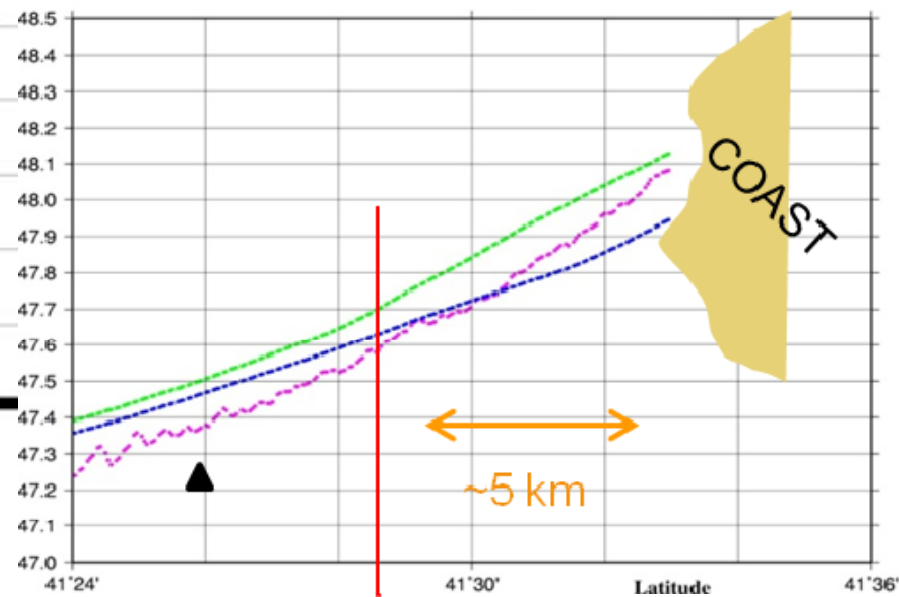

- Centimetric differences between CNES-CLS 11 and local MSS at large scale and very small scales

- On this exemple better correlation between DTU10 and CERGA

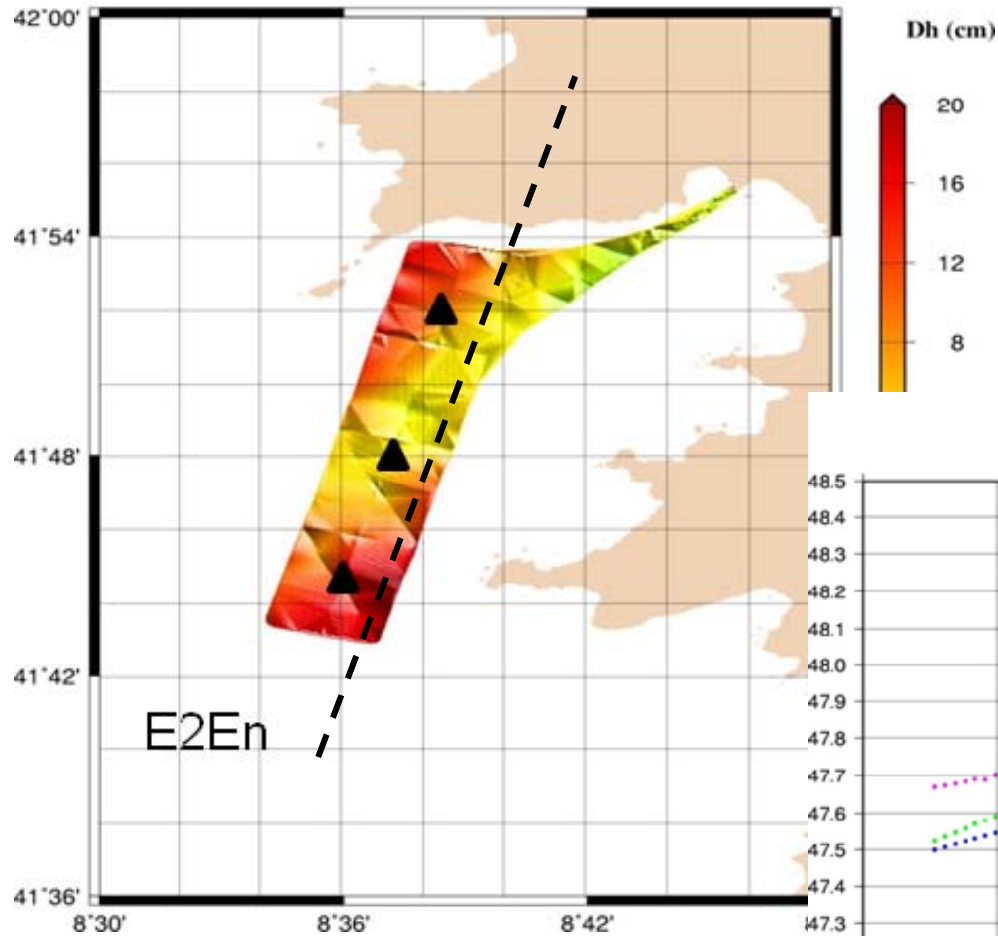

CERGA  
CNES\_CLS11  
DTU10

Change in slope

# Comparisons with Local GPS MSS

MSS CERGA – CNES\_CLS11 (cm)

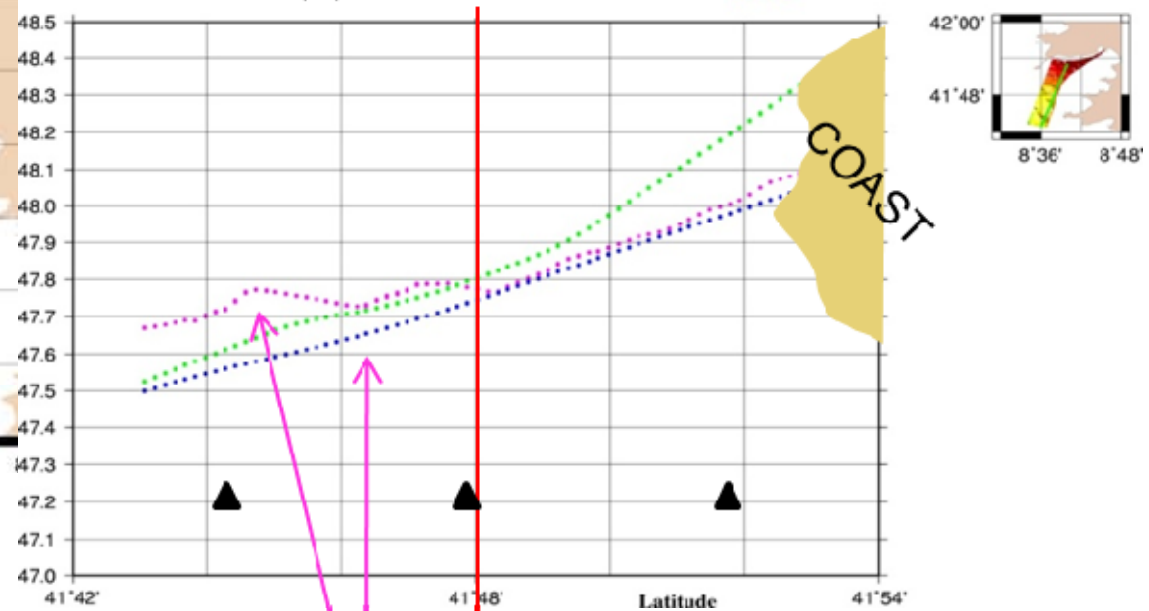

- Behaviour different on this exemple. difference in the average is due to the interannual variabilité (Ajaccio=2009 / Senetosa=1999)

- On this exemple better correlation between CNES\_CLS11 and CERGA

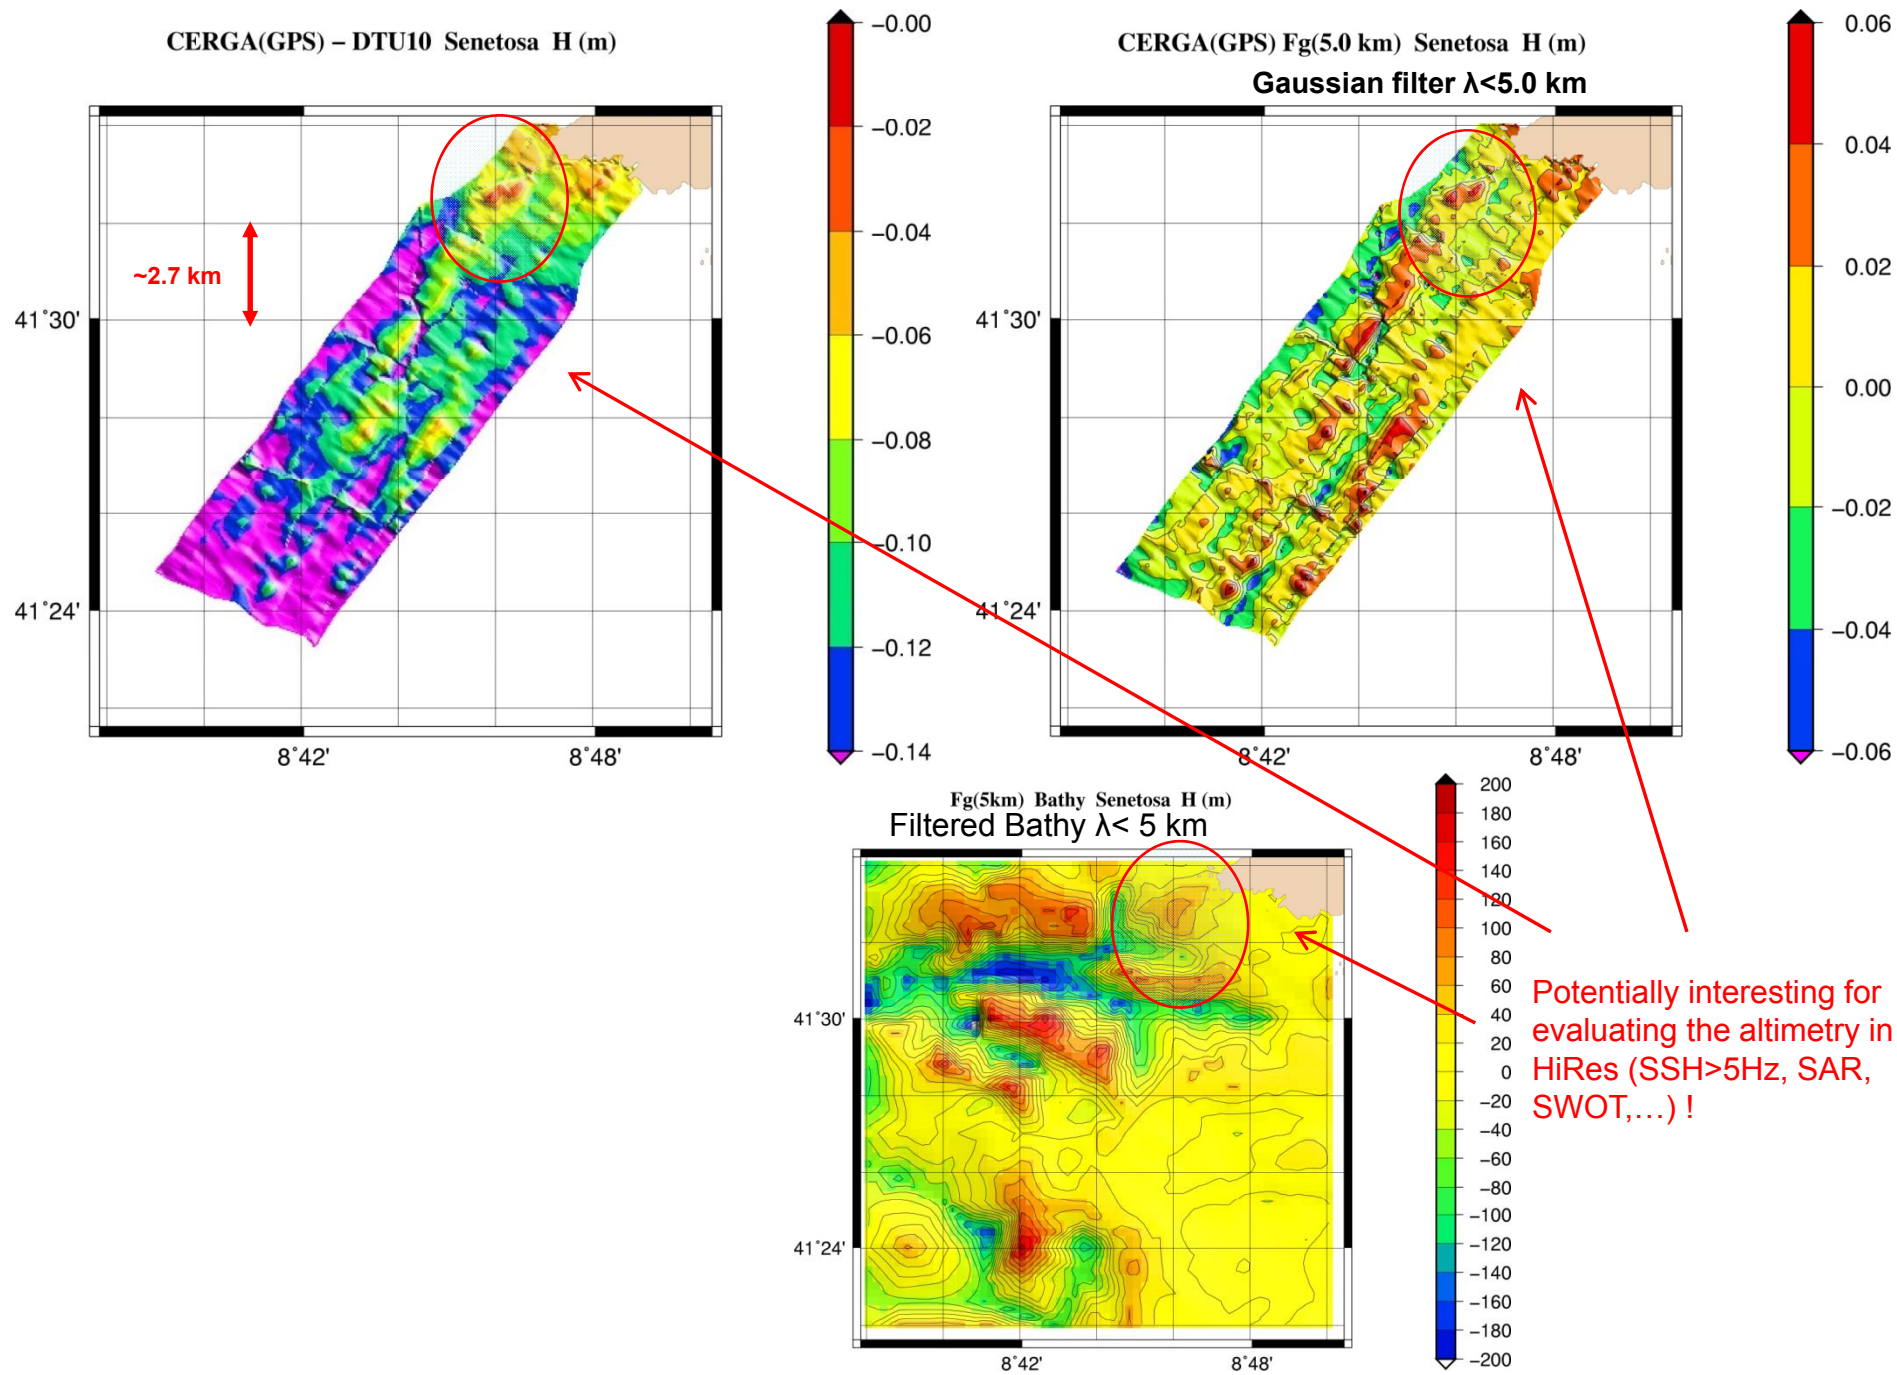

CERGA  
CNES\_CLS11  
DTU10

MSS CERGA Ajaccio  
H(m)

« artefact » in GPS MSS ?

# GPS/CERGA MSS reveals structures at very short wavelengths ! (is it realistic ?)

## Conclusion

- A new MSS, MSS CNES\_CLS11 is available to user since summer at <http://www.aviso.oceanobs.com/en/data/products/auxiliary-products/mss/index.html> (netcdf format)
- Good performances in open ocean,
  - ✓ drastic improvement of short wavelengths of MSS CNES\_CLS11.
  - ✓ Reduced degradation of Envisat SLA after the orbit change
- Homogenization of interannual signal : crucial to reference the MSS on the same period for intercomparison
- Comparison to GPS High Resolution MSS: interesting exercise and interesting to extend comparisons over largest areas.
- Perspectives
  - ✓ Data of missions with new Ground track, not included in this version are or will be available in 2012: Envisat drifting Phase, Cryosat, HY2
  - ✓ Reprocessed dataset with recent standard will also be released: Envisat, Reaper, GDRD CNES Orbits, ...

**=> Very good perspectives to improve the quality and resolution of MSS**
