OceanCurrent - Ocean Surface Currents and Temperature

News

30 September 2011: Update on our move to IMOS
The initial round of changes to the [existing website](#) are now complete but we are not quite ready to shift the site to the [new IMOS address](#) which presently only shows a subset of all the content.
[\[news archive\]](#)

Prepared maps and animations

		
---	--	---

[\[what's shown\]](#) [\[animation won't play?\]](#)

Imagery for import into Google Earth

 [\[West Australia, with details for SW\]](#) [\[archive - unavailable at present\]](#)
[\[East Australia, with details for SE\]](#) [\[archive - unavailable at present\]](#)

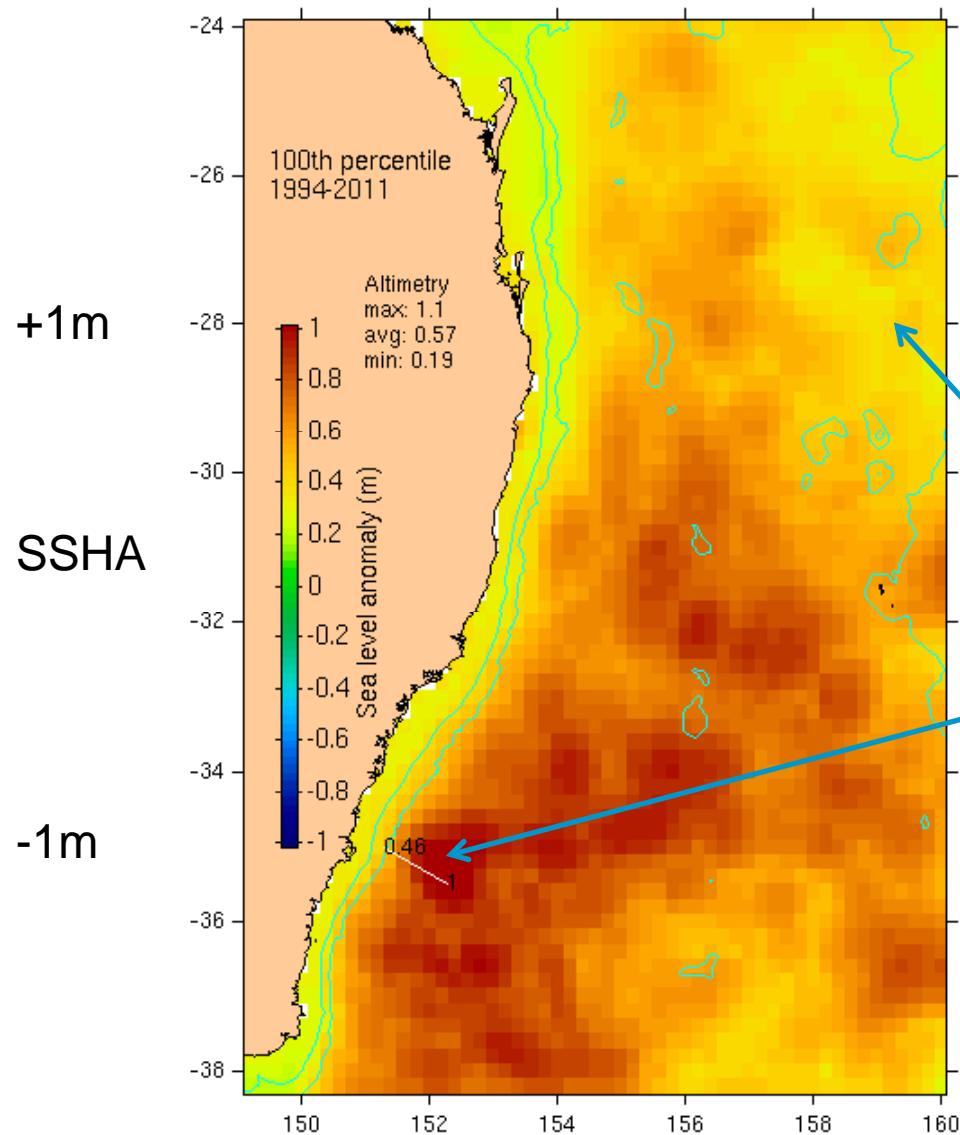

Atmospheric pressure contours (2 hPa): 17-Jan-2011
Isostatically adjusted sealevel anomaly: 17-Jan-2011

SST: 18-Jan-2011. SVP drifters (magenta): 12 Jan - 20 Jan
Sealevel contours (0.1 m) and geostrophic velocity: 17-Jan-2011.

Is it extraordinary?
Lets look at some history

Maximum (in 1994-2011) gridded altimetric (+ filtered tidegauge) sea level anomaly:

+1m

SSHA

-1m

wide range:

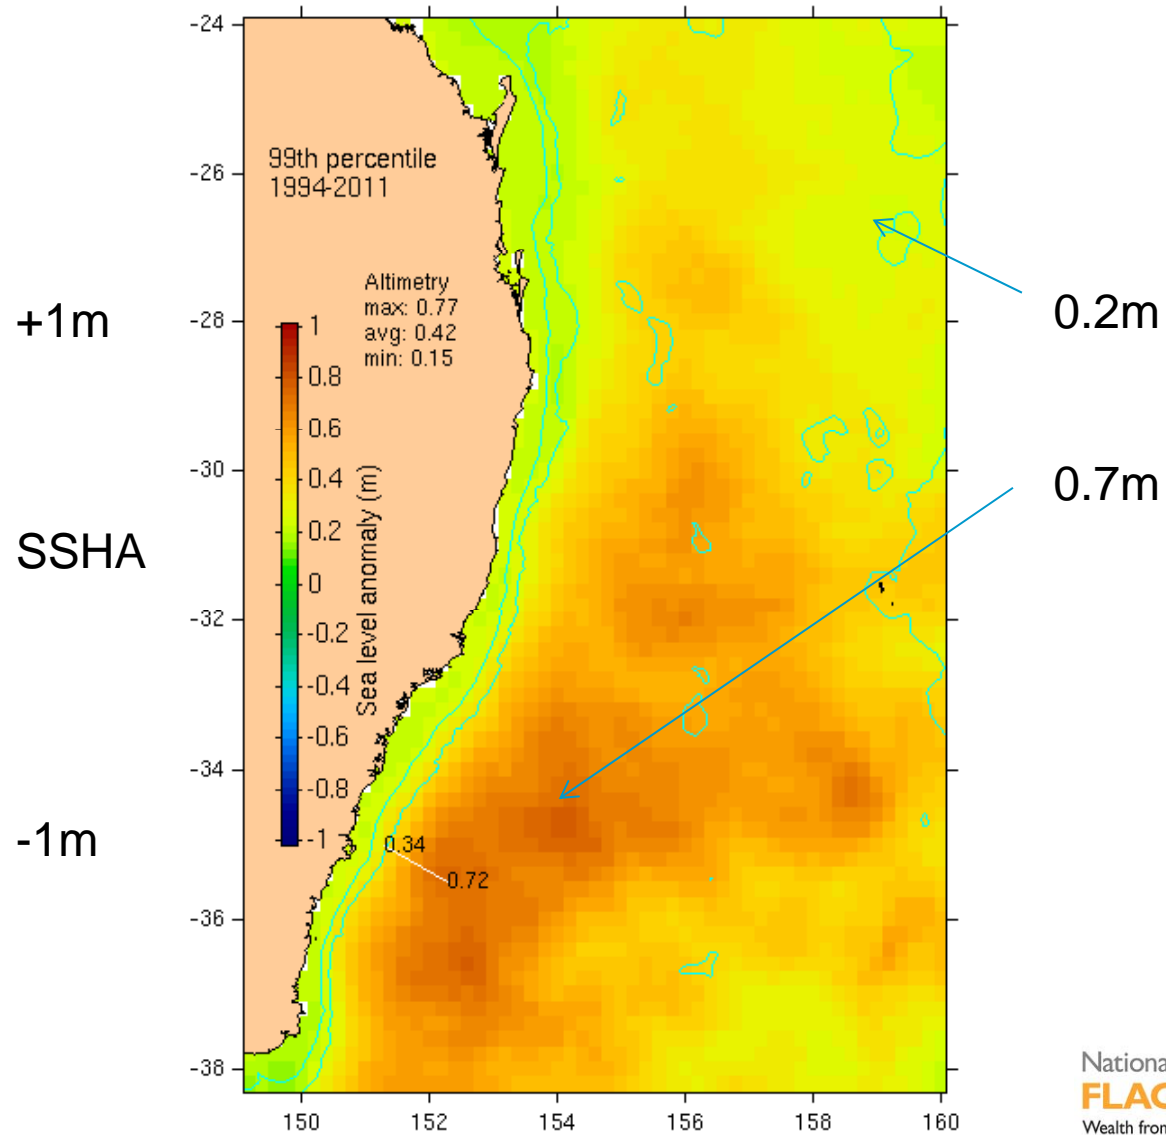

0.3m

to

1.1m

Extraordinariness
cannot be judged
from a single
SSHA map.

99th percentile anomaly (exceeded 1% of time) NB: 30% less than 100th percentile

1st percentile anomaly (exceeded 99% of time)

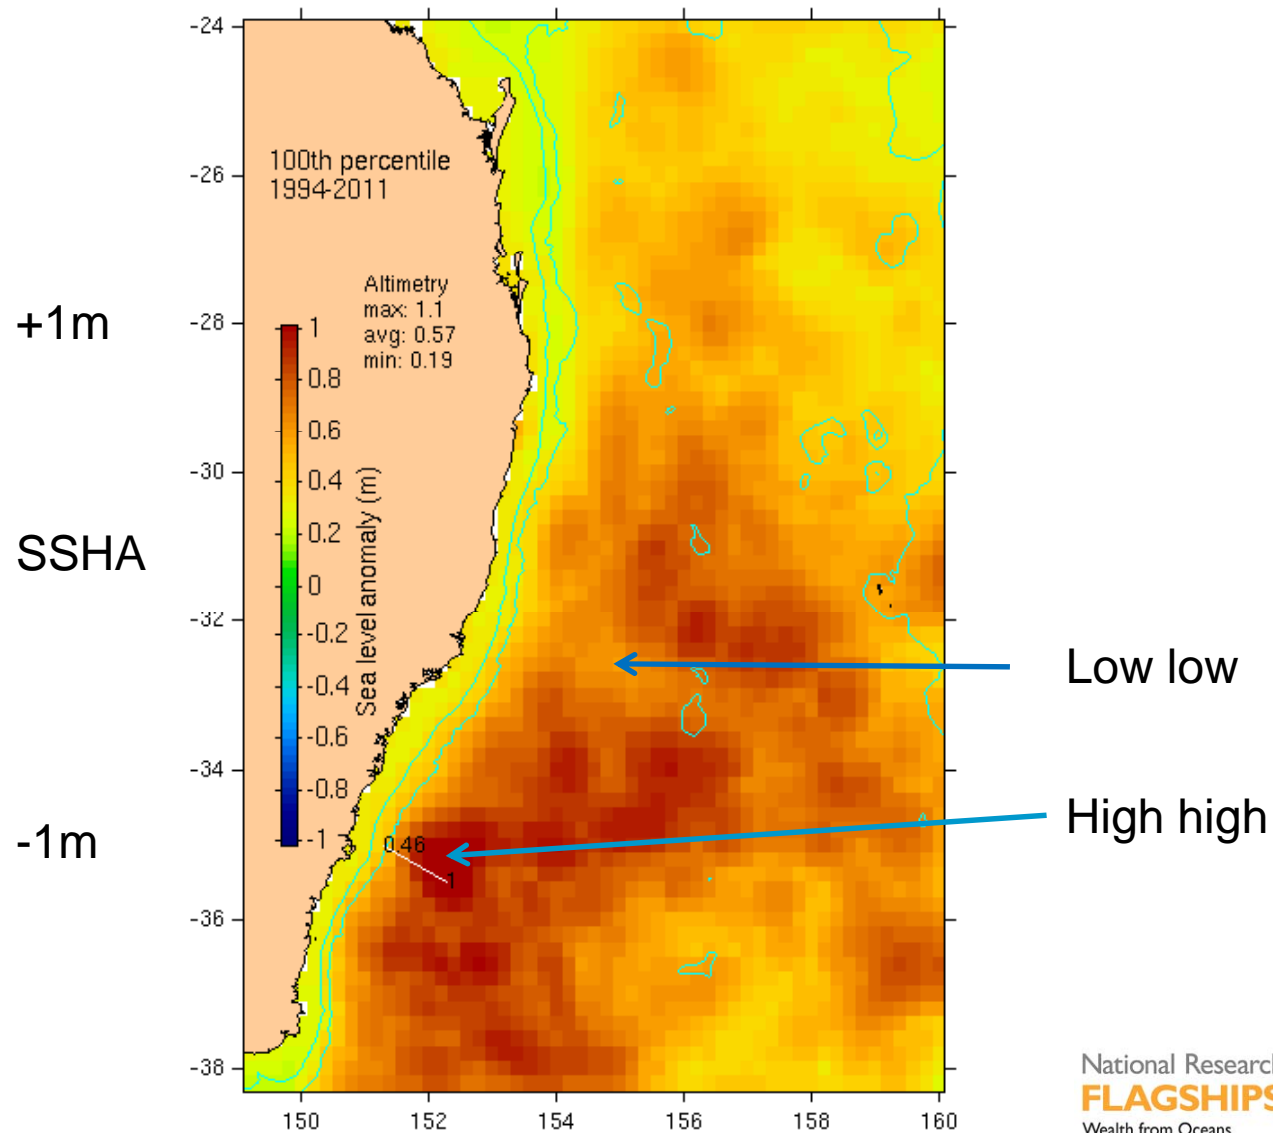

Minimum elevation (0 %-ile) is 30% more extreme than 1st %-ile

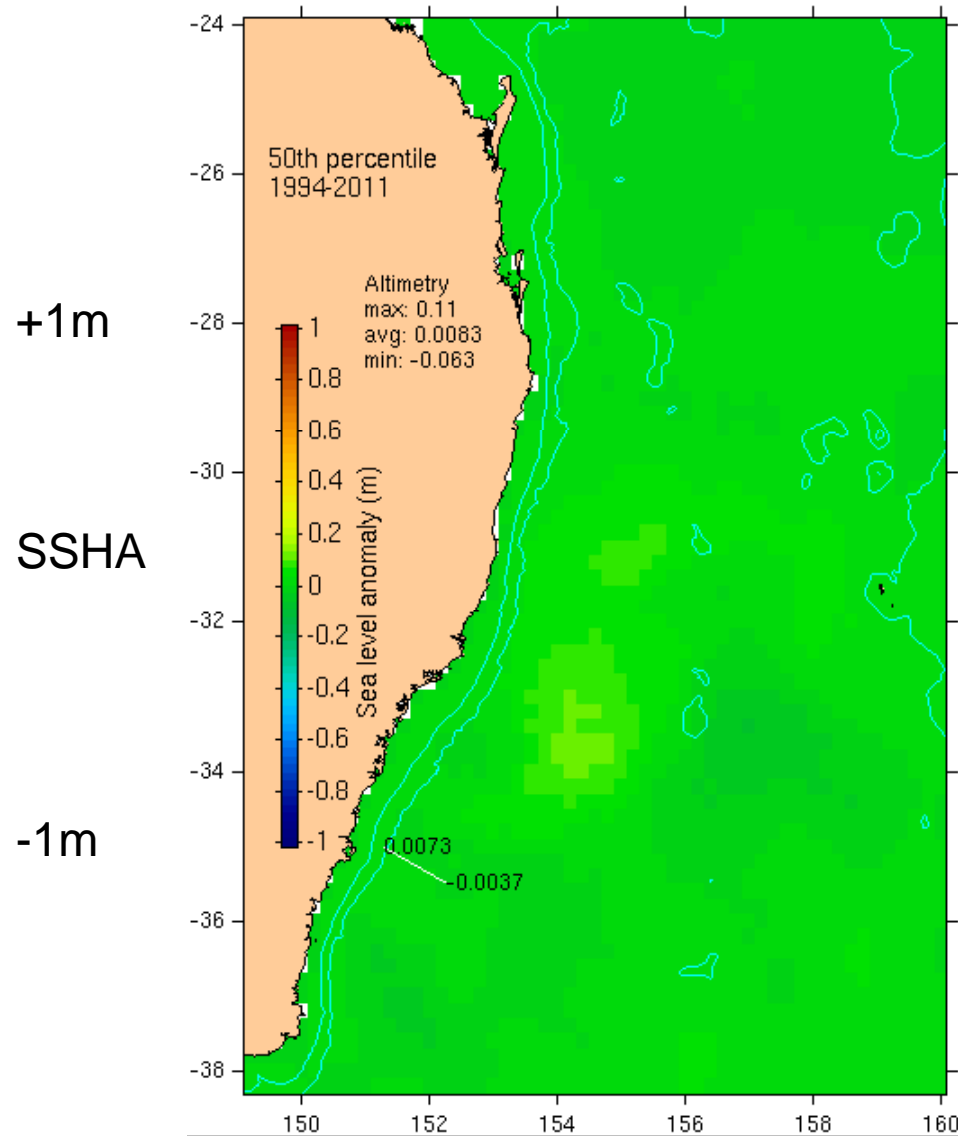

Insert presentation title

Maximum anomaly map again. highest highs are south of the lowest lows

Median elevation (50th percentile) near zero – i.e. distribution is fairly symmetric

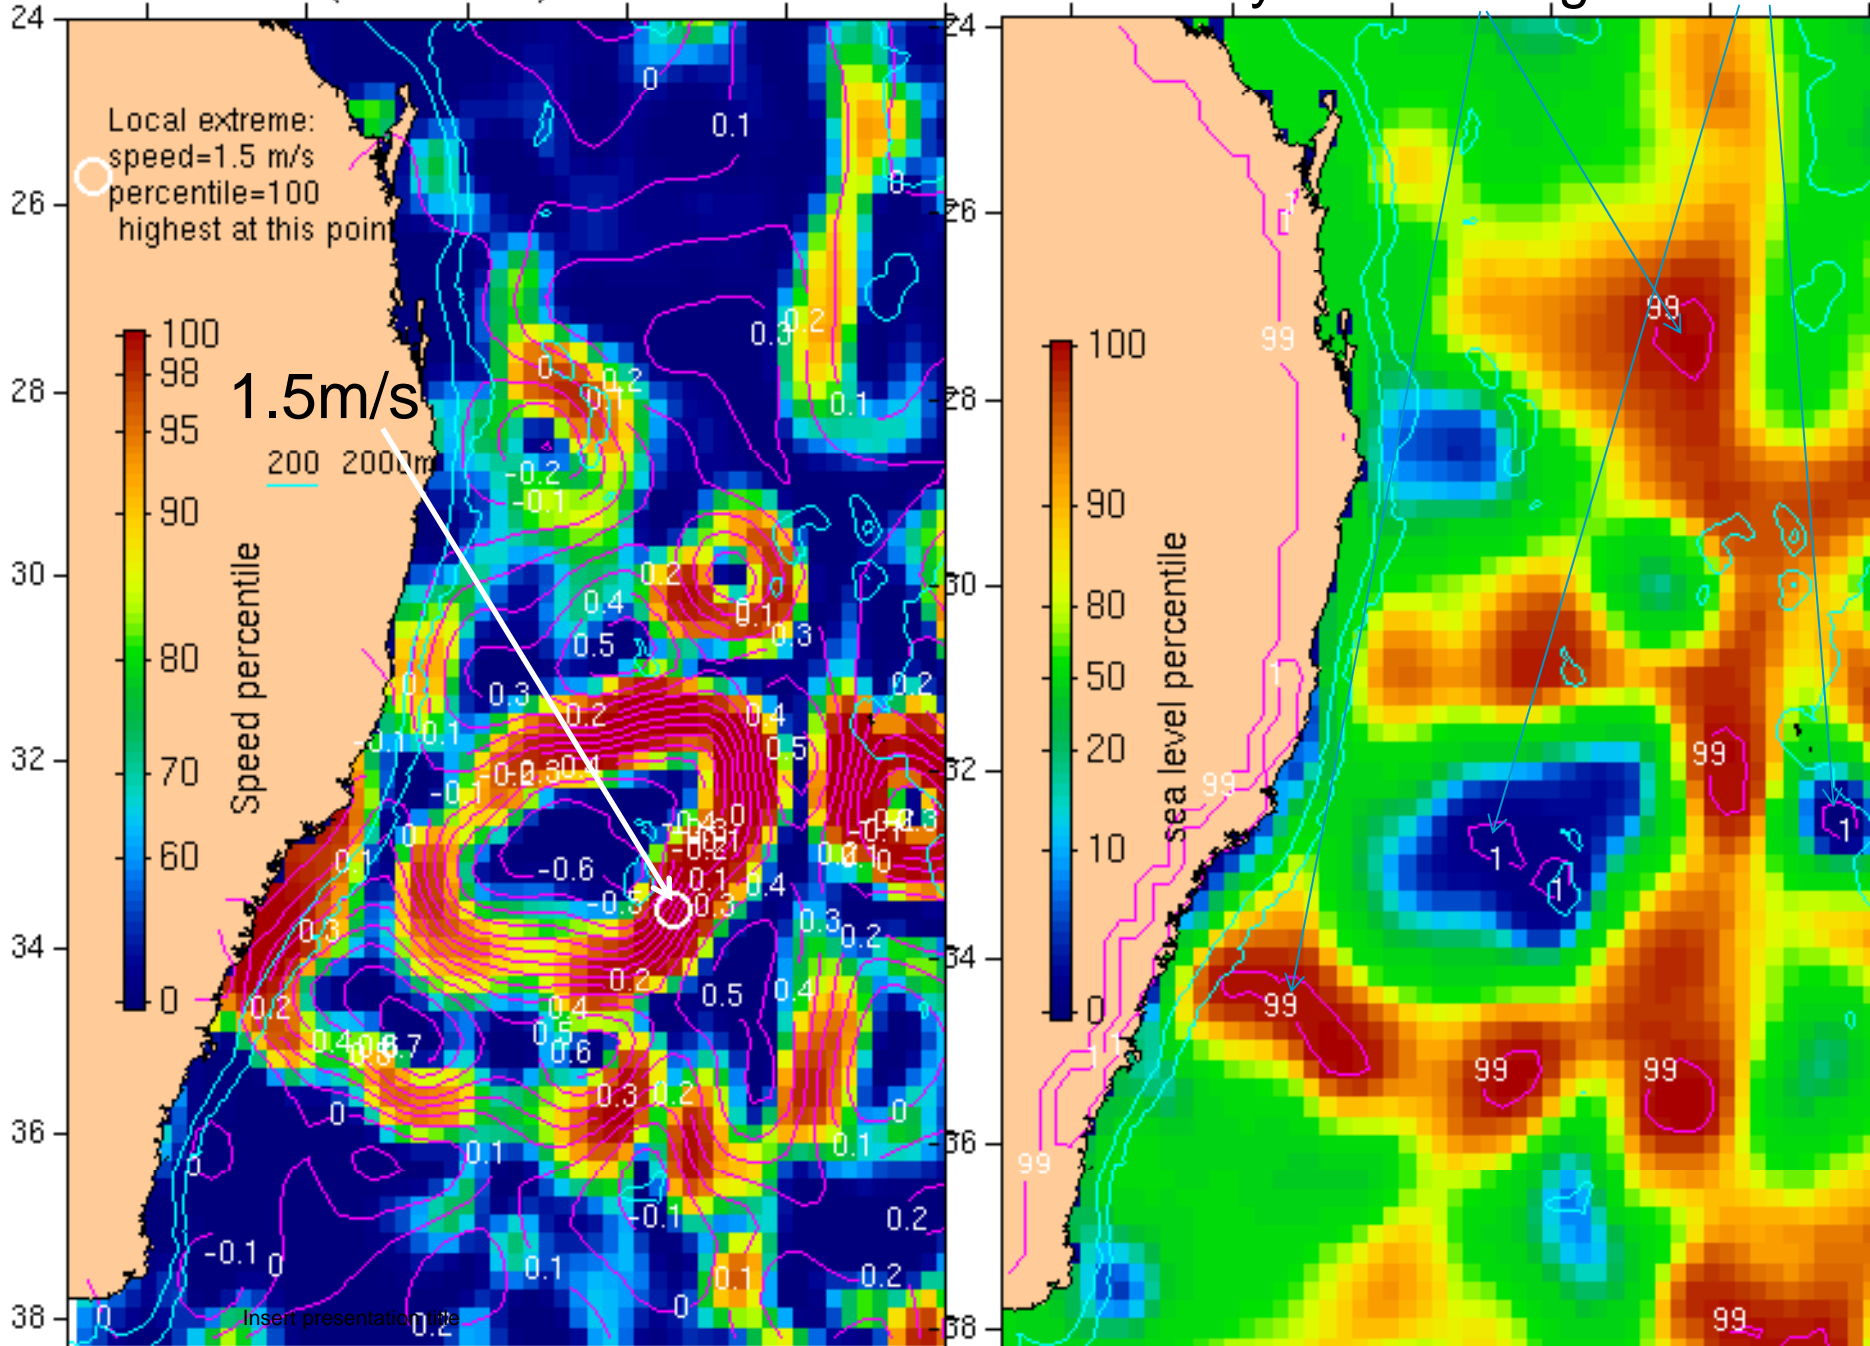

Atmospheric pressure contours (2 hPa): 17-Jan-2011
Isostatically adjusted sealevel anomaly: 17-Jan-2011

SST: 18-Jan-2011. SVP drifters (magenta): 12 Jan - 20 Jan
Sealevel contours (0.1 m) and geostrophic velocity: 17-Jan-2011.

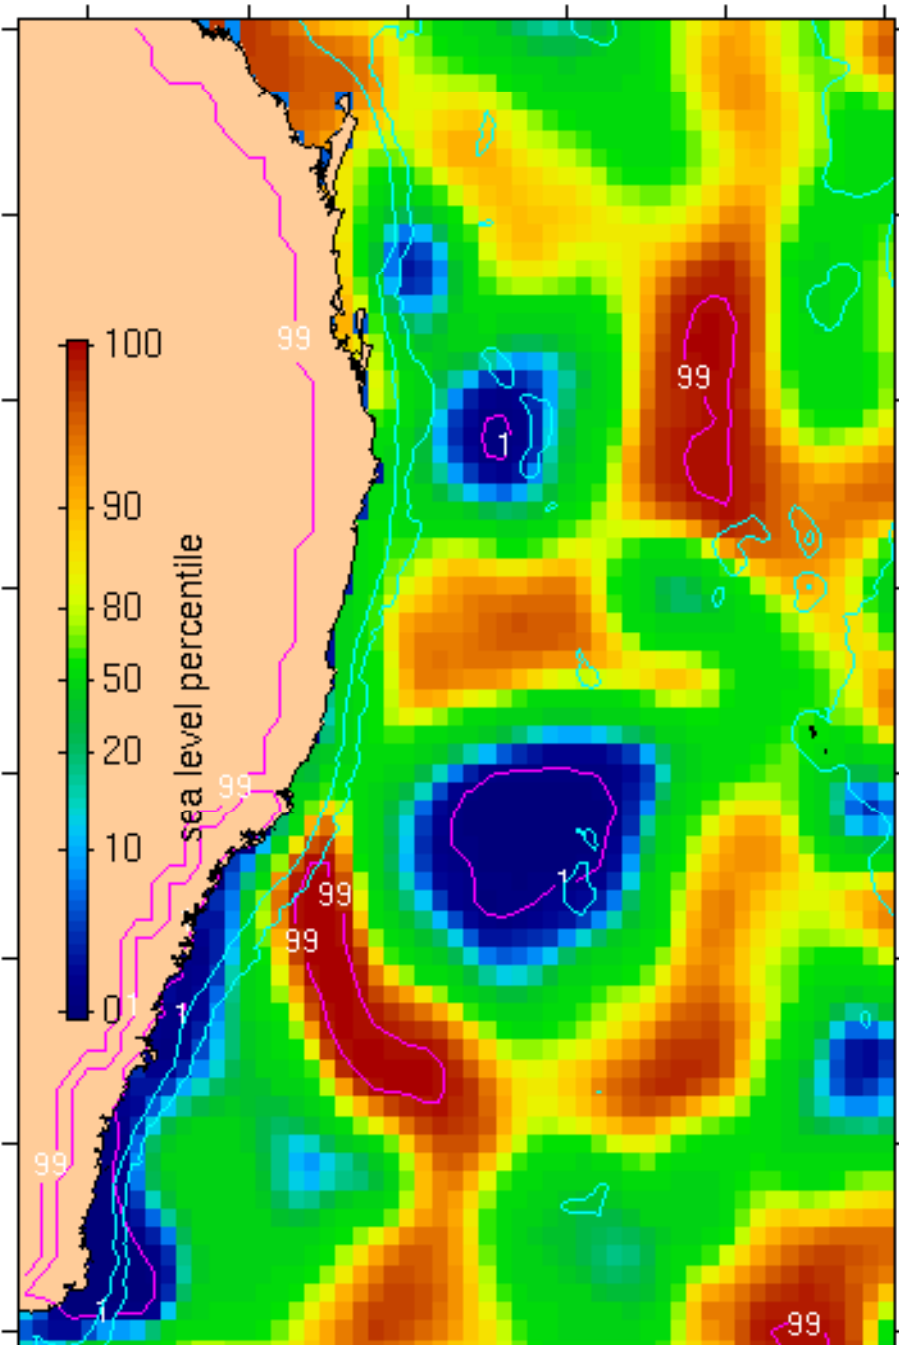

Is it extraordinary?

%-ile ranking (cf 2175 times in 1994-2011) of geostrophic speed, and altimetric SLA (0.1m contours) on 16-Jan-2011 **16 Jan 2011: Many extreme highs and lows**

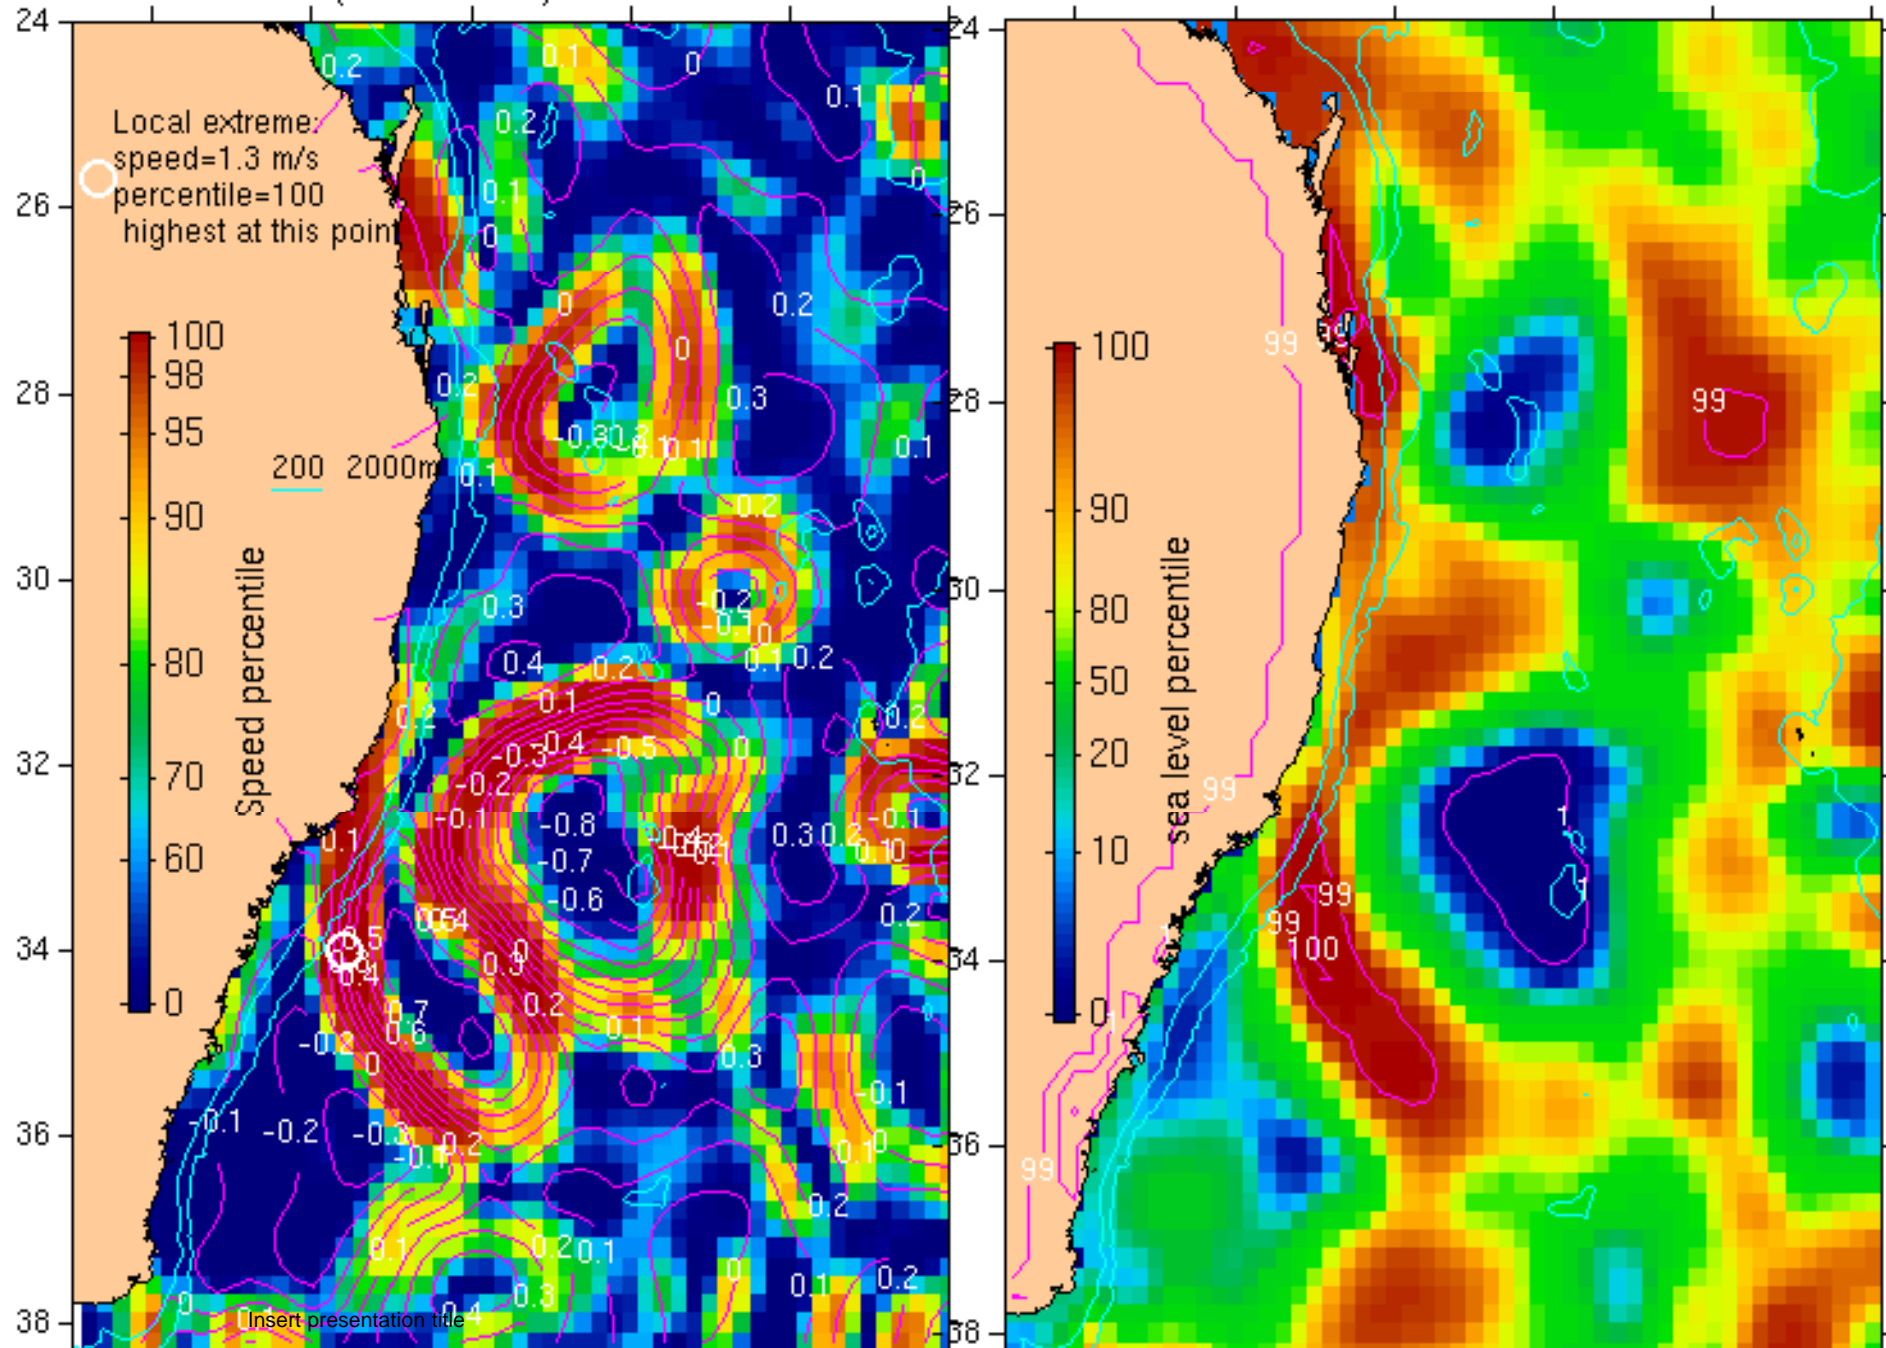

%-ile ranking (cf 2175 times in 1994-2011) of geostrophic speed, and altimetric SLA (0.1m contours) on 12-Jan-2011

Back 4 days (to 12 Jan)

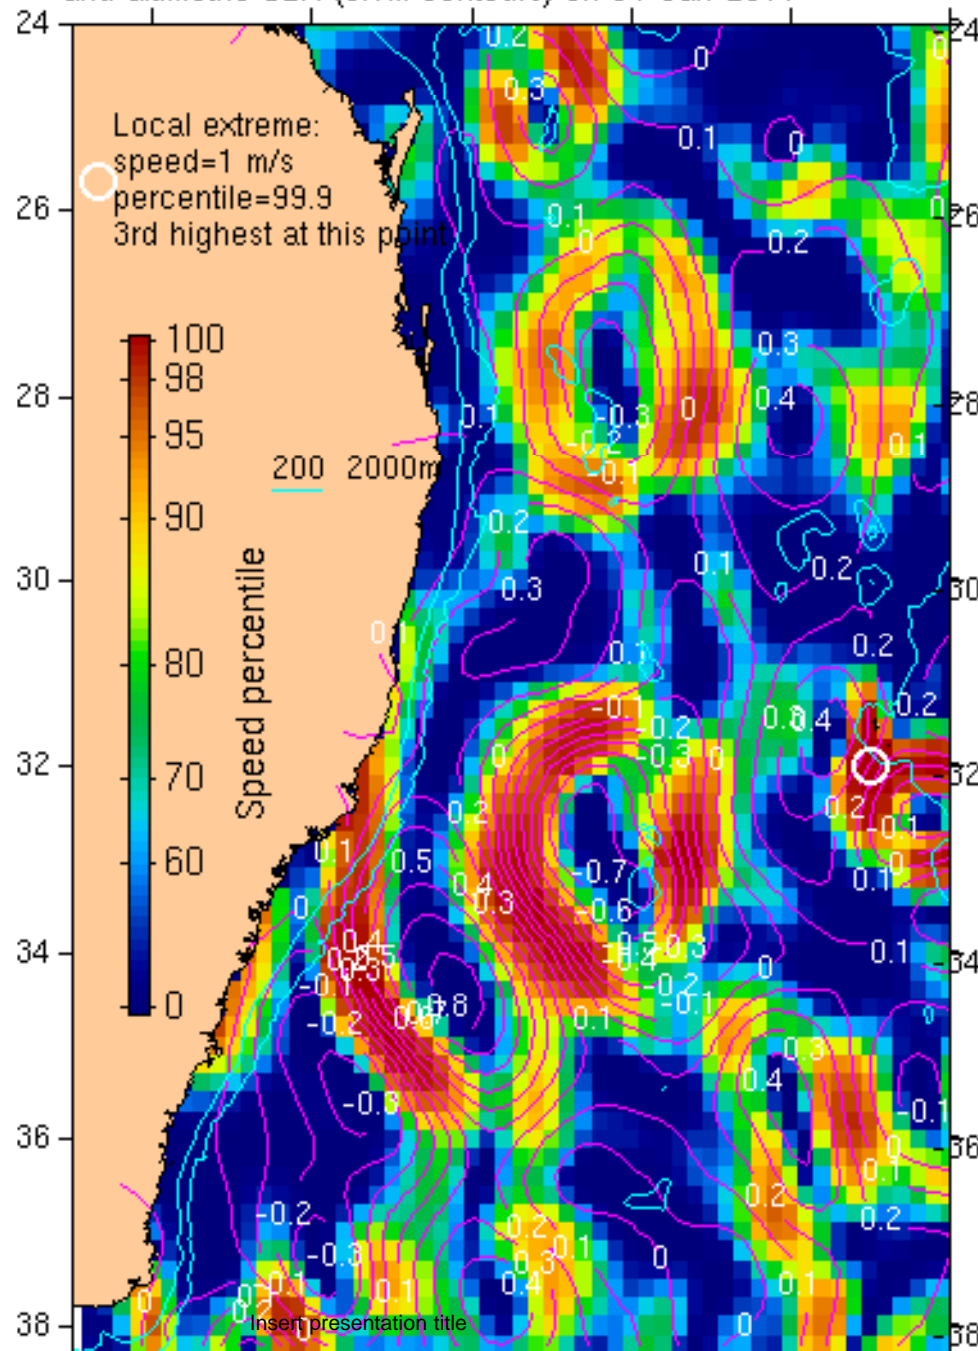

%-ile ranking (cf 2175 times in 1994-2011) of geostrophic speed, and altimetric SLA (0.1m contours) on 08-Jan-2011

Back 4 days (to 8 Jan)

%-ile ranking (cf 2175 times in 1994-2011) of geostrophic speed, and altimetric SLA (0.1m contours) on 04-Jan-2011

Back 4 days (to 4 Jan)

%-ile ranking (cf 2175 times in 1994-2011) of geostrophic speed, and altimetric SLA (0.1m contours) on 31-Dec-2010

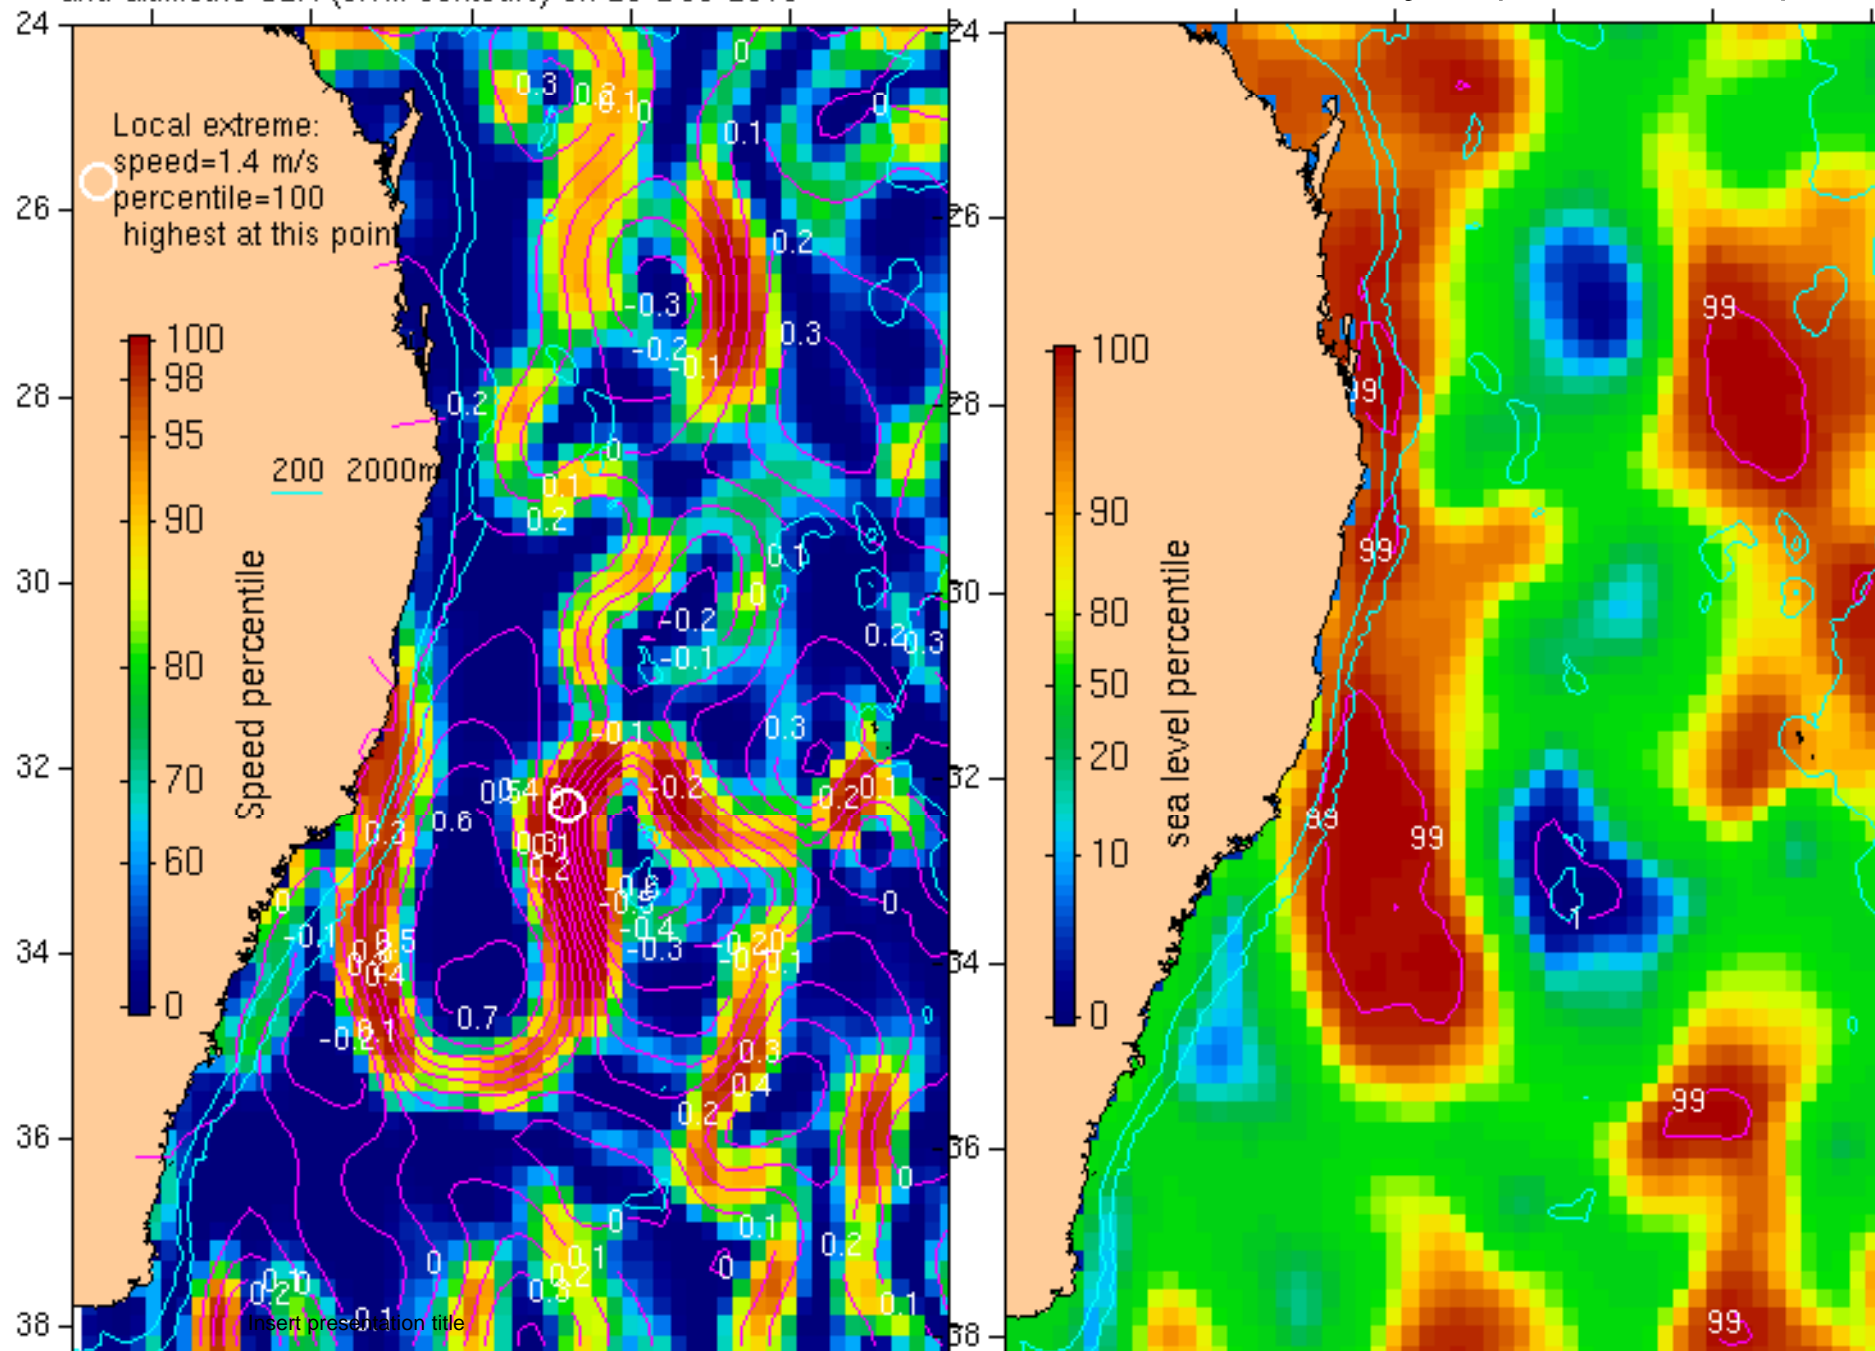

Back 4 days (to 31 Dec)

Insert presentation title

%-ile ranking (cf 2175 times in 1994-2011) of geostrophic speed, and altimetric SLA (0.1m contours) on 23-Dec-2010

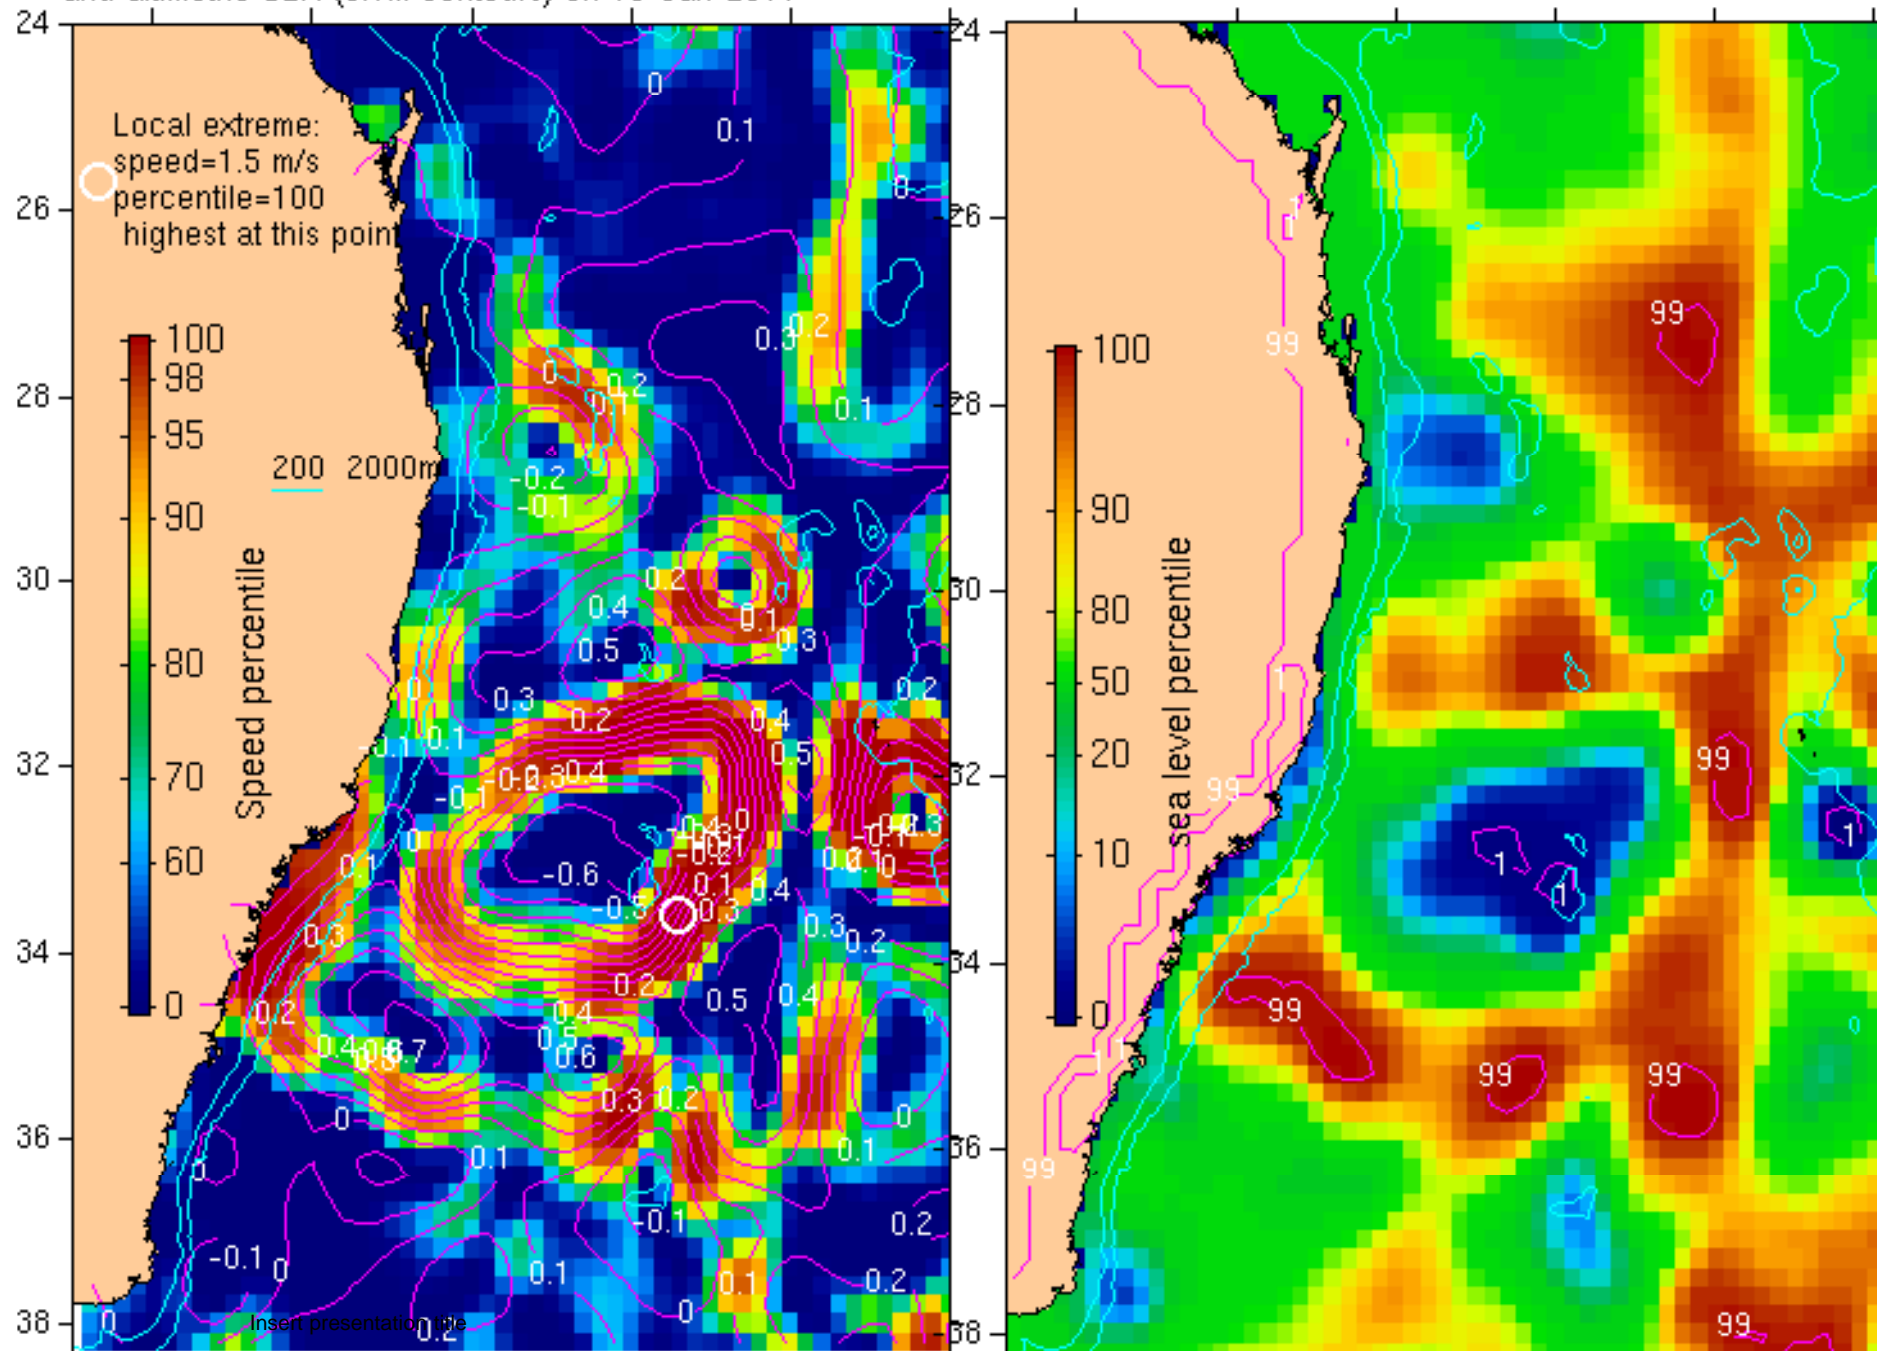

Back 4 days (to 23 Dec)

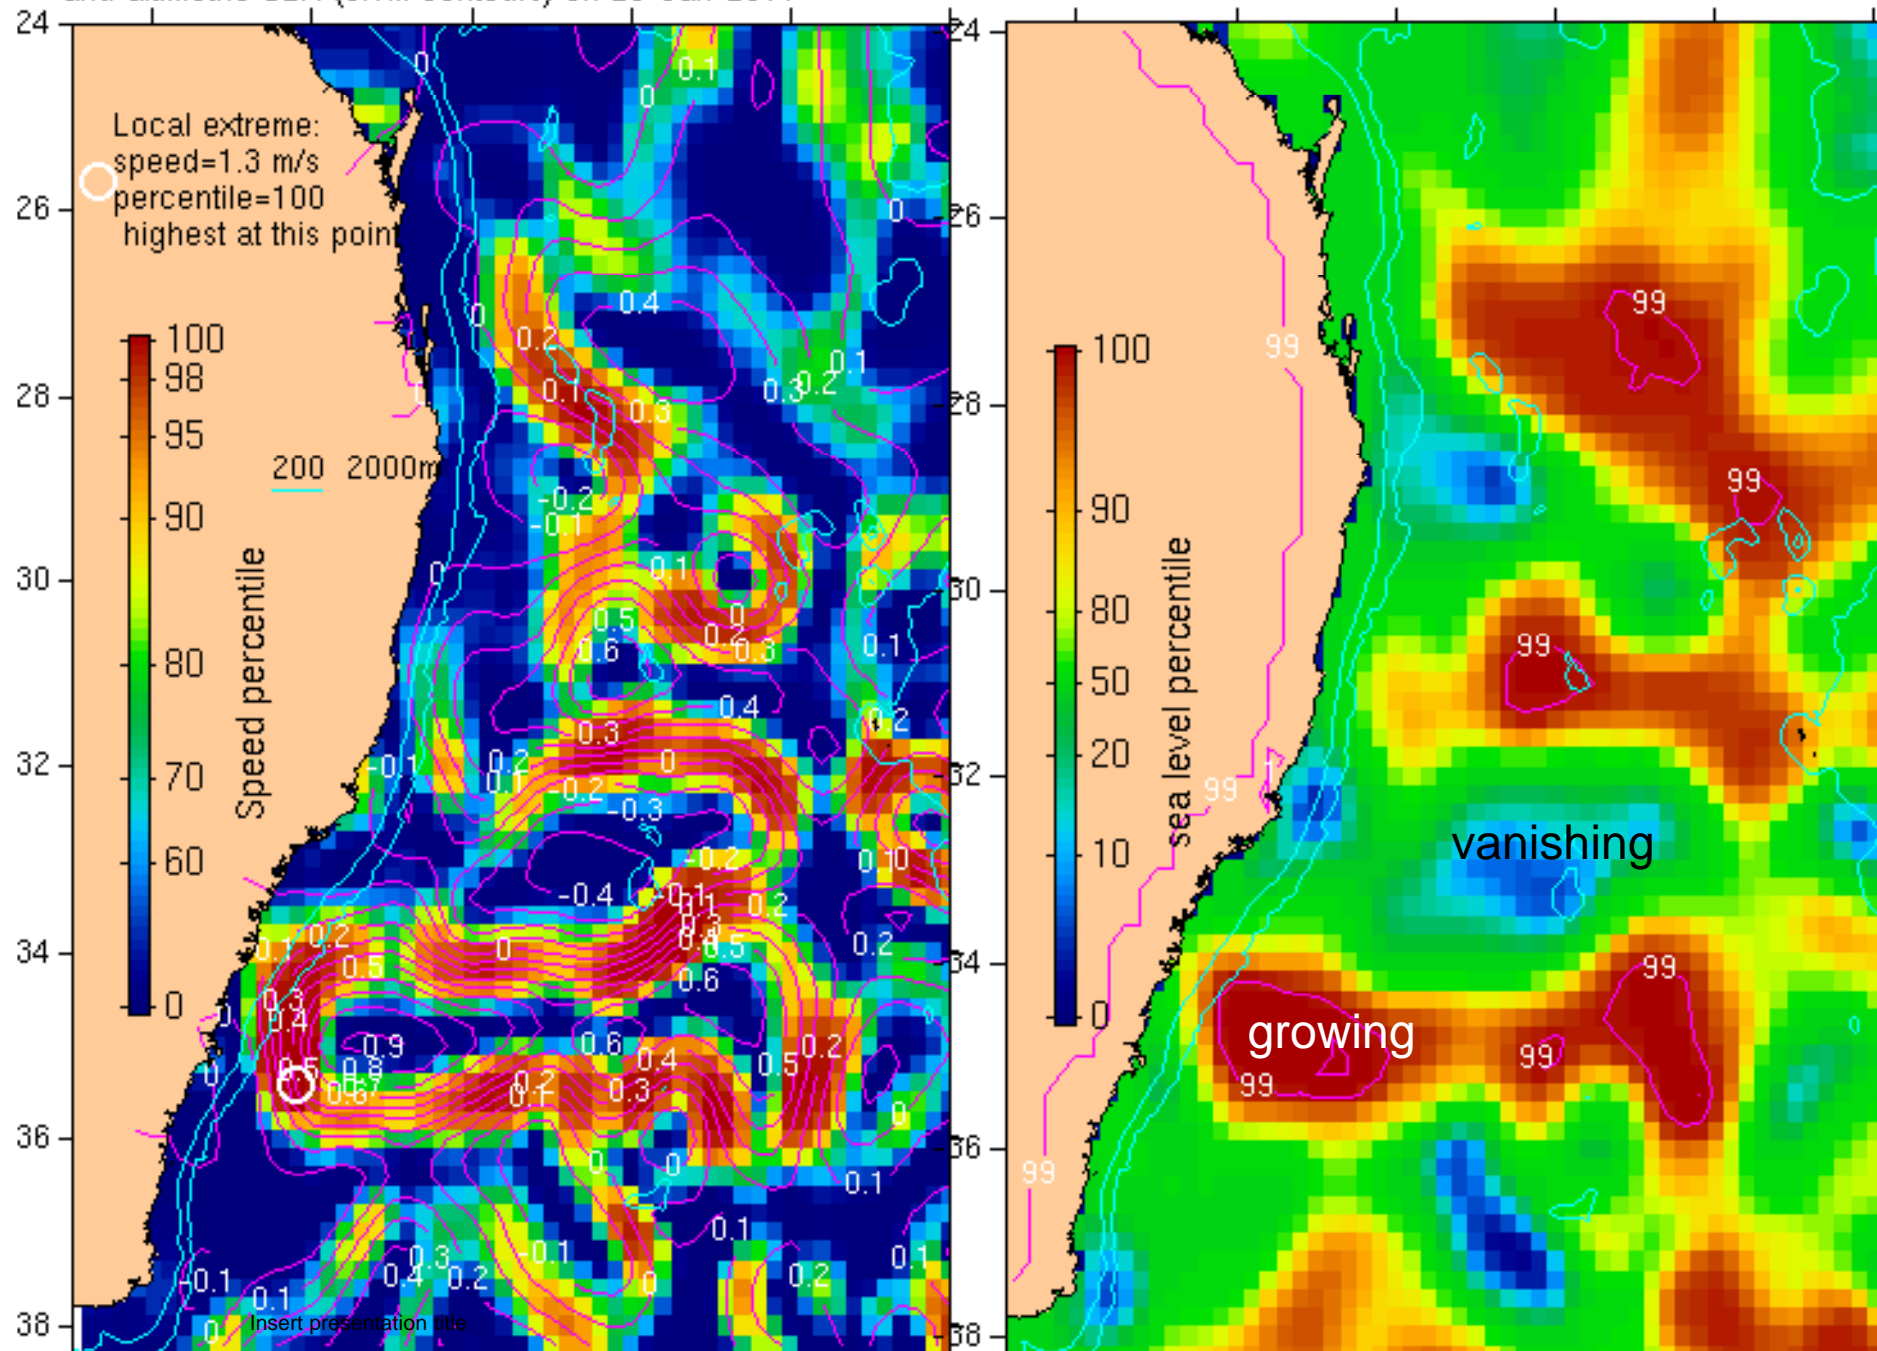

That high sea level all along the coast was not a 'storm surge'

- Coastal sea level was very high. Anomaly of nearshore current was zero. Odd situation – still needs investigation.
- Lets now go back to 16 Jan then step forward.

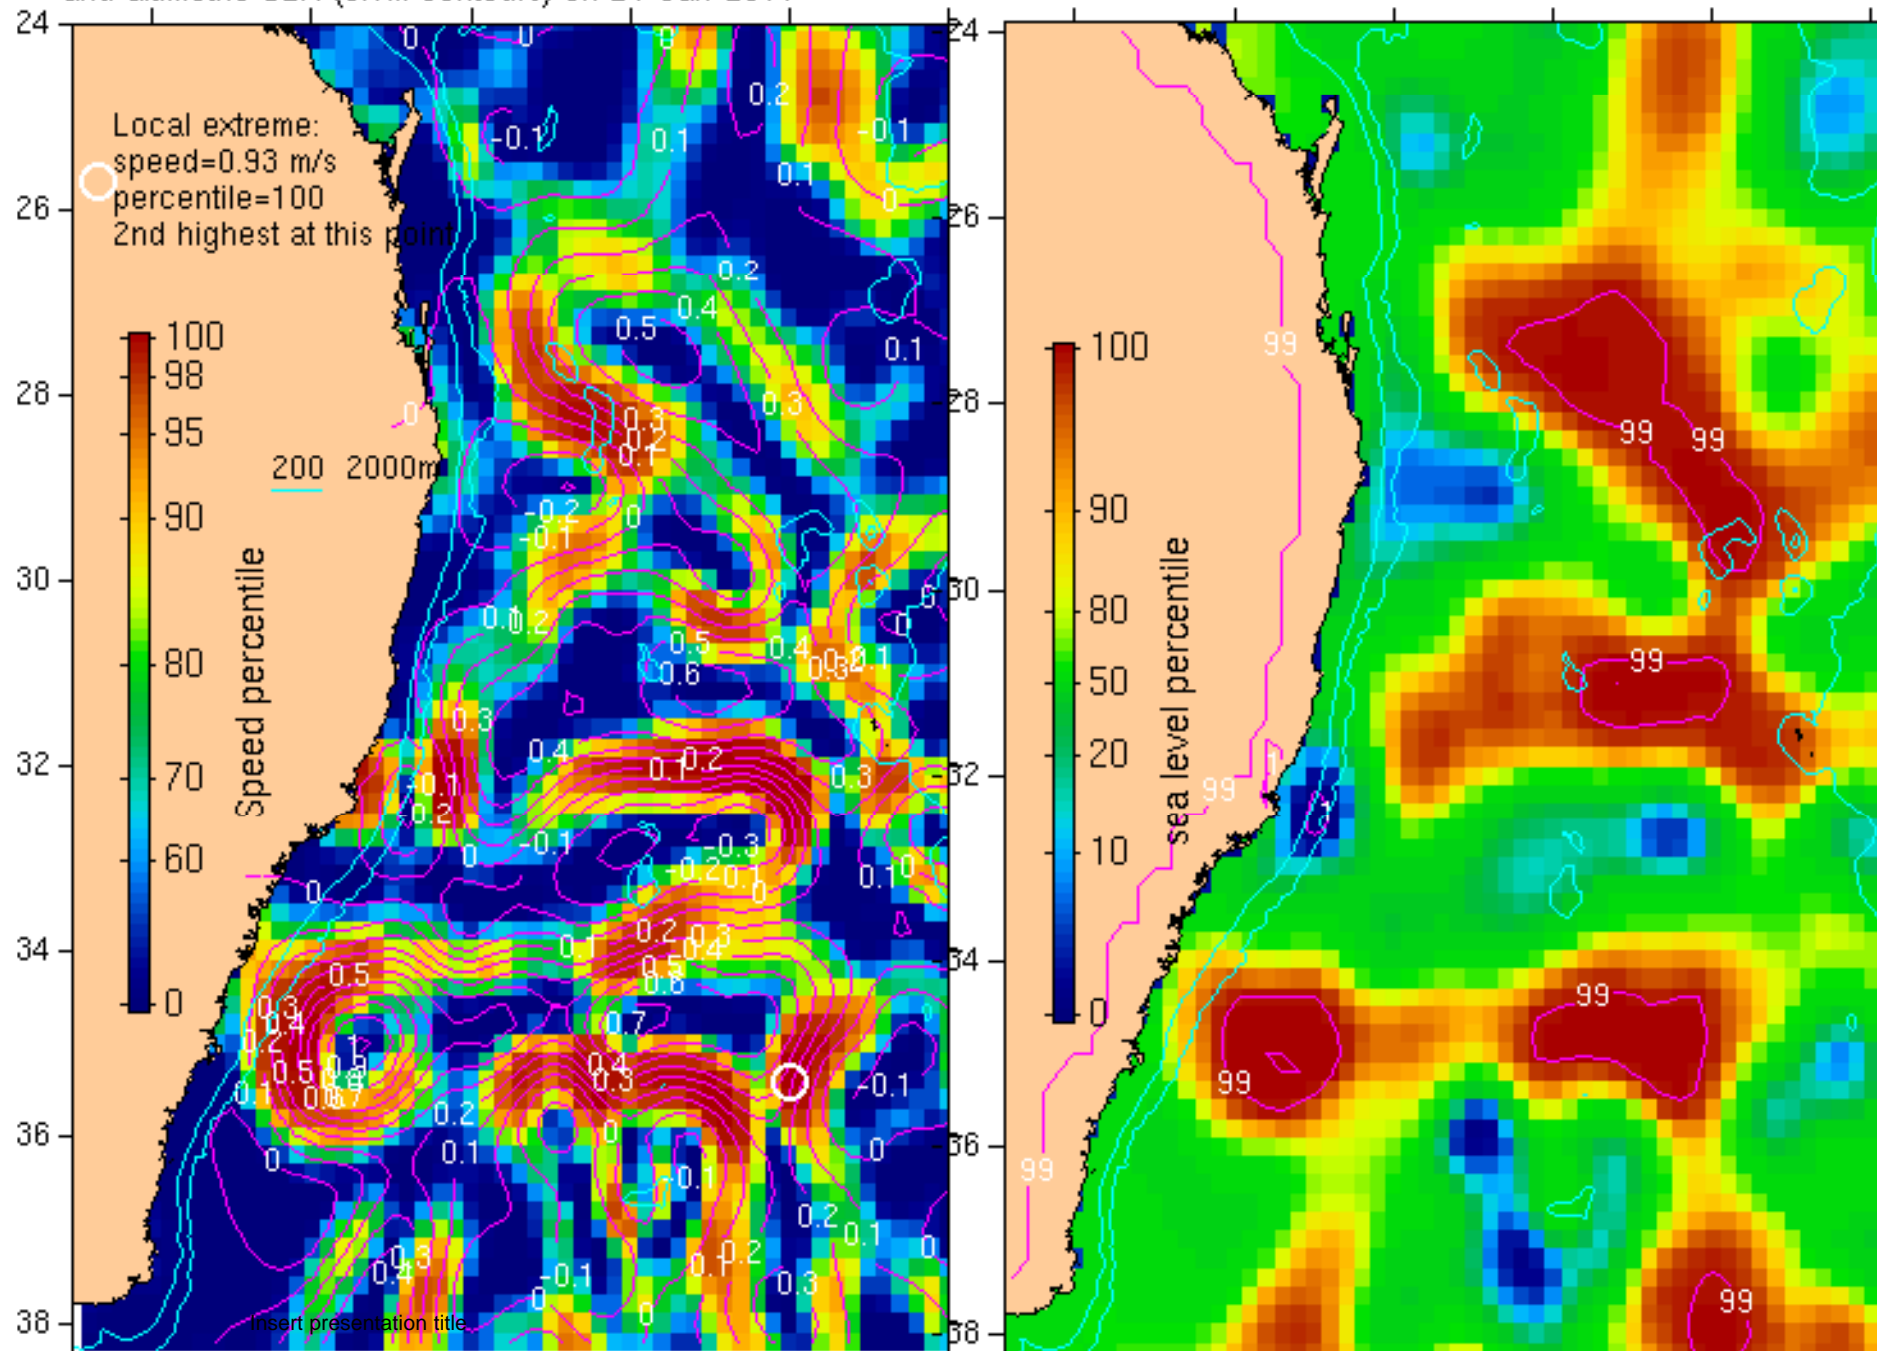

%-ile ranking (cf 2175 times in 1994-2011) of geostrophic speed, and altimetric SLA (0.1m contours) on 16-Jan-2011

%-ile ranking (cf 2187 times in 1994-2011) of geostrophic speed, and altimetric SLA (0.1m contours) on 20-Jan-2011

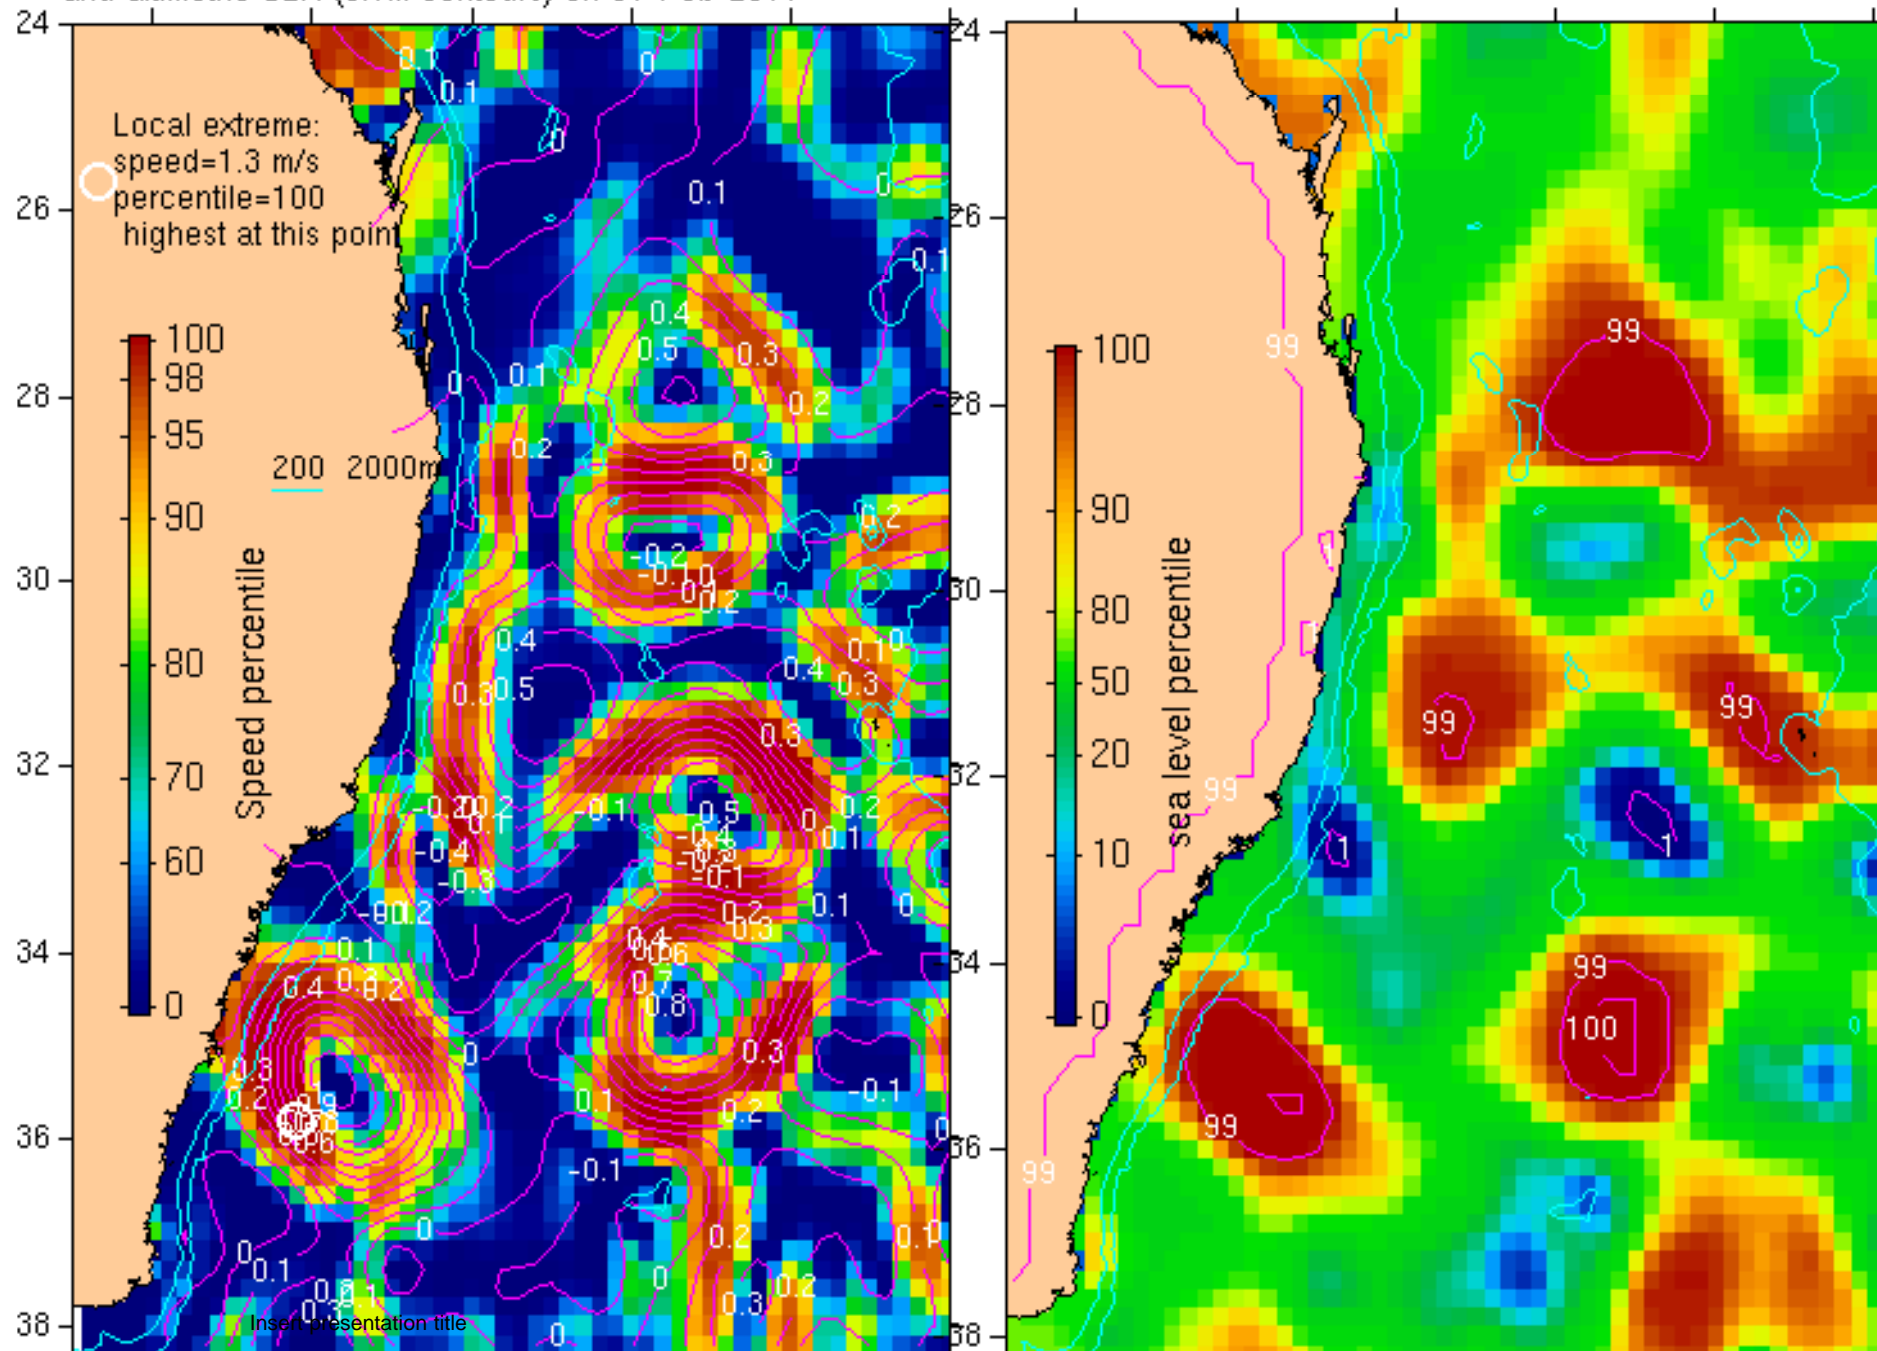

%-ile ranking (cf 2187 times in 1994-2011) of geostrophic speed, and altimetric SLA (0.1m contours) on 24-Jan-2011

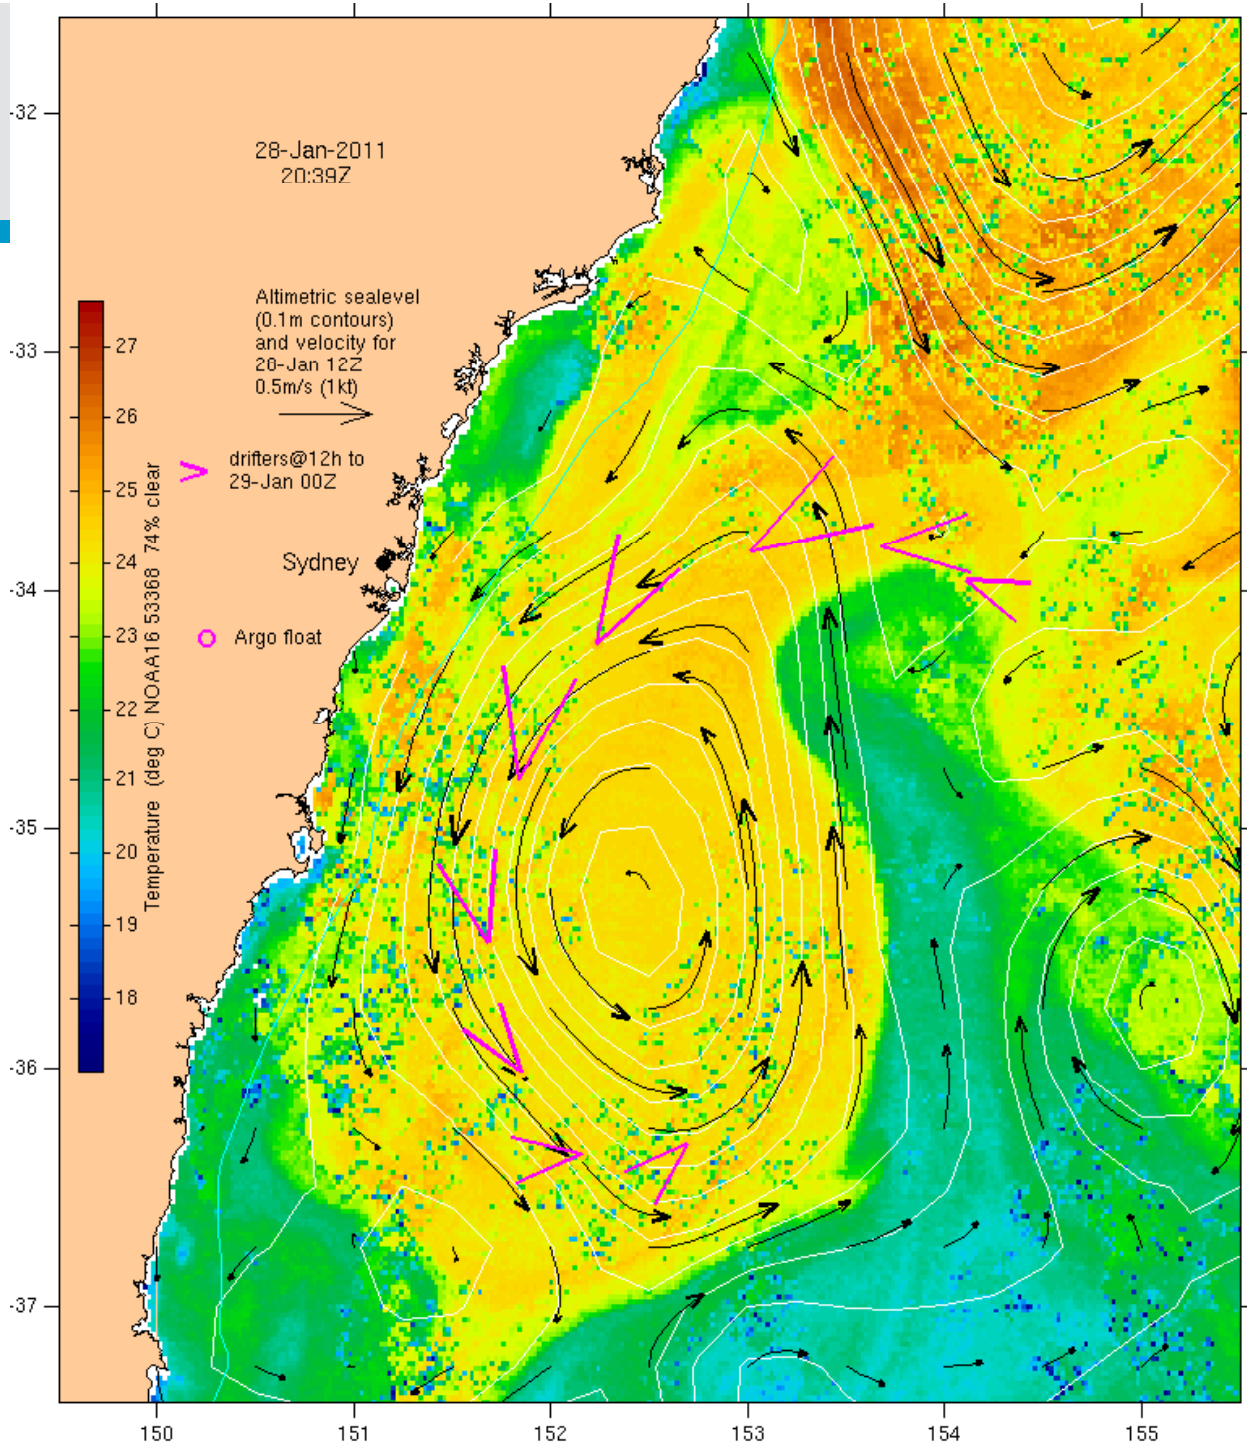

%-ile ranking (cf 2187 times in 1994-2011) of geostrophic speed, and altimetric SLA (0.1m contours) on 28-Jan-2011

%-ile ranking (cf 2187 times in 1994-2011) of geostrophic speed, and altimetric SLA (0.1m contours) on 01-Feb-2011

So, that's how a record-breaking East Australian Current warm-core eddy was born

- Existence of strong coastal currents obvious to all mariners
- What is the link to the extreme La Nina?
- The area-average current speed usually has a January maximum off SE Aust:

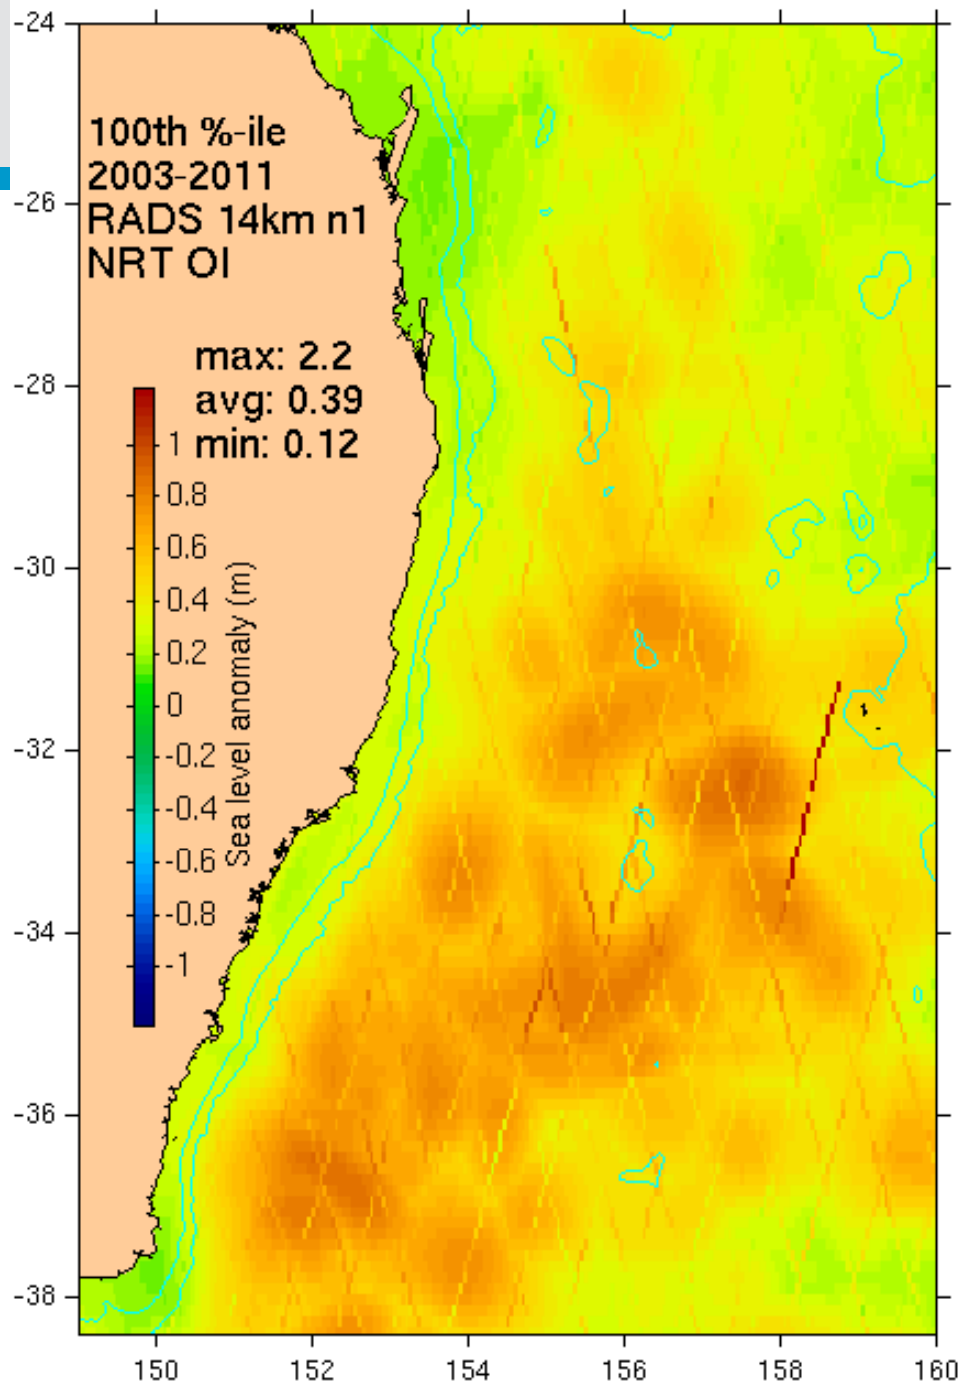

Back to the question of quality control:

- New approach (for us) to real-time QC:
- Reject data by comparing with historic extrema
- Eg: *at each point in space* use only $1.5 * \min < SSHA < 1.5 * \max$
- Much more discriminating than spatially invariant limits
- But: how do the stats of track data compare with stats of maps?

A: very closely:
Min of tracks ~ =
min of maps.

Only 1 bad Envisat
track in
RADS at present:
SSHA = -2m
(=3*minimum)
not edited by
standard RADS
editing

Max values:
Same result

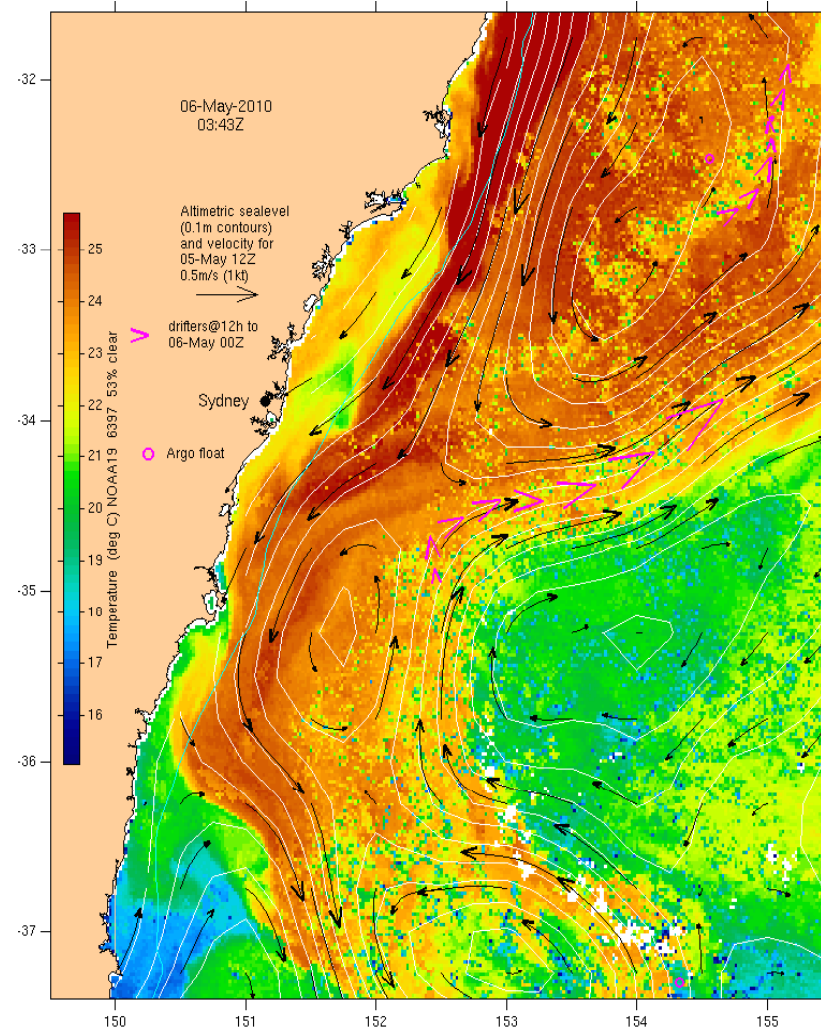

Discussion

- It is tempting not to focus on the extreme values in a data set, or to think much about the shape of the distribution function, and how it varies in space.
- Extreme values in Near-Real-Time data are often errors: indeed, some erroneous NRT maps were found during the production of this talk.
- By definition, the genuine extreme values are rare, and pose a challenge to automatic quality control.
- But it is essential not to be lazy here. (Modellers might be reluctant to assimilate unseen values into an operational model).
- For operational oceanography to become a reality, we must build systems that do not fail when they are most needed .

Thankyou

- We thank the many people and agencies (ESA, EuMetSat, CNES, NASA, NOAA, Argo, Drifter program) for the data shown here.
- We look forward to including Altika in similar analyses
- ...and to getting CryoSat2 data closer to real time

- Our URL again: imos.aodn.org.au/oceancurrent
